*"We know the QL ... We've been appreciating it longer."*

## QL Special #1 — \$289.95

- > QL Computer-free ground shipping
- > WD Utility Prg. worth \$16.95
- > Subscription QL Report \$15.00
- > 8 Free programs including:
  - music program
  - windows demo
  - graphics pictures
  - calculator prg.
  - and more

— Take 20% off the following if ordered at the same time: ICE, QSpell and/or Centronics I/F

## QL Special #2 — \$299.95

- > QL Computer
  - > Free I.C.E. ROM
  - 1 CON-based front end operating system for QL
  - > \$8.00 shipping
- packages include the 4 Psion programs.  
These same 4 prgs. are also avail. on the IBM and retail for \$695.00.

## QL Special #3 \$299.95

- > QL Computer
- > Your Choice of One Piece of Pyramide Software FREE:
  - Wanderer
  - Peintre
  - Othello
  - Nucleon
  - Vroom

OR

## QL Special #4 — \$299.95

- > QL Computer
- > Free UPS 2nd Day Air Shipping

All Packages include the Psion Programs — Word Processor, Data Base, Spread Sheet and Business Graphics.

## COMMENTS by the editor

### Commodore...Soon to join our ranks?

It's been a downhill slide ever since Jack saw the greener grass over at Atari, packed his bags and left Commodore, the company he saw rise to prominence in just three years. Things are bad at Commodore. Real bad. Experts say the company is losing nearly 120 million a year—that figures out to be around 3 million a week!

If Commodore does bail out, one can only wonder what's in store for countless enthusiasts world-wide. Will the small company and cottage industry be the main source of support, just like our own community emerged two years ago? Will the slick magazines bail out (just like SYNC and TIMEX/SINCLAIR USER did)? A lot of aftermarket software and hardware houses are counting on the health of Commodore for their very existence.

What does all of this mean to you and me? Actually, I want to use Commodore as a "vehicle" for my annual lecture on SUPPORT. Where would we be without our disk drives, printer interfaces, Spectrum Emulators; not to mention some really great home-brew software and various publications? We would have been dead in the water months ago.

Will our supply of computer "goodies" last. I believe so...but it will require everyone's participation and SUPPORT. Unless we send for that great-looking new program or board for our Sinclair, or even just respond to catalog offers that we read in newsletters and mags—we won't have Aerco, E. Arthur Brown, Zebra Systems, Novelsoft, Weym! Corp, Curry, Knighted—so forth and so on. If you have been thinking about a new purchase...now is the time...tomorrow maybe a little too late.

I always wonder as I'm "pasting up" the ads in TIME DESIGNS, just how many readers actually pay attention to them. Some company has paid us good money for a spot in the magazine. This helps offset our production costs. Please SUPPORT our dear advertisers, they SUPPORT us.

Well, another lecture has come to a close. I'll get down off my soapbox now. Enjoy this issue of TDM, and get ready for the next one—our Second Anniversary Issue. And what a celebration that one's going to be!

*Tim Woods*

**CRITICAL MASS (Arcade)**

An outlying system of the Terra Federation has set up an advanced anti-matter conversion plant on a centrally positioned asteroid to supply the local colonists with energy. A surprise attack by alien forces has successfully overgrown the asteroid's defenses and the aliens are now threatening to self-destruct the power plant unless the colonists offer an unconditional surrender. The self-destruction process would effectively turn the power plant into a massive black hole that would wipe out the entire planetary system along with a number of nearby stars. Unconditional surrender offers an equally horrific prospect. Your mission is to infiltrate the enemy position and disable the anti-matter plant before the aliens achieve **CRITICAL MASS**.

CATALOG #1026 \$15.95

**SABOTEUR (Martial Arts Arcade Adventure)**

You are a highly skilled mercenary trained in the martial arts. You are employed to infiltrate a central security building which is disguised as a warehouse. You must steal a disk that contains the names of all the rebel leaders before its information is sent to the outlying security stations. You are working against the clock, both in getting to the disk, and in making your escape. You must enter the building from the sea by rubber dinghy, and will then only be able to leave by the helicopter on the roof. You will have to find your way around the warehouse, making use of the guards' own weapon supplies in your struggle through overwhelming odds.

CATALOG #1098 \$15.95

\*\*\*\*\* **DUAL DISC DRIVES & INTERFACE FOR QL --\$250.00** \*\*\*\*\*

**DUAL DISK DRIVES & INTERFACE  
FOR YOUR QL COMPUTER .....**

Now you can cut the rising costs of data storage on your QL in half (at least). These 3" drives are answer to your prayers.....top quality and they hold about 160K per side (the "hard" cased floppies can be flipped over) for additional 160K of storage space! And, don't forget the great convenience (not to mention the super reliability of these disks) of having a second disk drive on line! All this...including and we'll even put the WP,DB,SS, and BG programs on one of the two disks supplied with the drives -- ready to run -- and our regular disk drive interface **ALL INCLUDED.....NOW ONLY \$249.95 !**

**DISK DRIVES**

ADD 5.00 S&H

3" DISKS - (for above) - Encased in hard plastic with a sliding metal "door" to keep dust (& fingerprints) from getting onto the disks. The metal door opens automatically when the disk is put into the drive. **BULLETIN - A NEW FACTORY JUST OPENED UP IN HONG KONG TO PRODUCE THE 3" DISKS - WE BELIEVE A PRICE REDUCTION FOR THESE DISKS WILL FOLLOW SOON! \$4.50 each or 10 Disks for \$43.50**

To the Editor,

I really enjoy your magazine and please keep up the good work! I have a question...do you know of any BBS program for the 2068 (using the 2050 modem)?

I have included two graphic printouts that I made using a program that I call "draw". Hope you enjoy them as much as I did making them.

Truly yours,

Clifton Tiddle  
Diamond Bar, CA

Editor: Clifton, you're in luck. I just talked to Eben Brown on the phone, of E. Arthur Brown Co. [3404 Pounce Drive, Alexandria, VA 22304, 615/761-8871]. He has a new BBS program that will be featured in his next catalog. It's called CASOARD 2068, and is available on either cassette or A/EJ wafer. The lead and save commands are in BASIC, so the program could be easily converted to any disk drive system. CASOARD was programmed by Karl Czuby, head known for his LOADER series of programs. Preliminary specifications sound great...and should be a lot of fun setting up a small home-based BBS. Price is \$19.95 plus \$1.95 for postage.

I did enjoy your drawings...and I've printed them here for others to admire.

Dear Tim,

Thank you for showing interest in my little gizmo. I have written to other publications, but no one even answered to say they were not interested. You have my permission to print my address. I will be glad to correspond with anyone who needs more information on adding automatic two-key entry from a one-key closure (to an external keyboard like the TI 994/A surplus keyboard).

Sincerely,

D. (Sandy) Rea  
Rt. 1 Box 18  
Priest River, ID 83856

Editor: I appreciate you sharing your circuit diagram with us.

Be sure to buy  
4046A chips  
"A" is for lower  
on Resistance.

Key Switch  
Entry Left

When key is closed, +5 volts is applied to both gate inputs. Gate #1 switches immediately closing switch #1 in 4066 for shift function. Gate #2, because of delay in charging C1 thru #1 switches after gate #1, closing switch #2 for cursor-left function. If this circuit is duplicated for more functions such as shift cursor-right, the shift key sections of the 4066 may be done in parallel, as many sections of the 4066 may be done this way, as desired. The gates' chip can be any OR function chip, TTL, CMOS or LS.

Tim:

I remember some time ago in TDM that you asked readers to send some simple programs for publication, so enclosed is one for the 2068, which you may use if you wish. As you can see, this calculates the number of days between any 2 dates (I think the limits are 1900 to 2010) and accounts for leap years, also.

By the way, in the Jan/Feb 86 issue, page 3, you published a T/S 1000 "bubble sort" for a reader. I could not make the program work without deleting line 230 (LET N=1).

Leo Schroeder  
Billings, MT

To the Editor and the Readers:

Can anyone come up with a simple program for my T/S 2068 which will print the characters immediately on the printer instead of on the screen? With this capability I would like to use the computer and its printer without the TV/monitor to do simple computations. Can anyone help?

Sincerely,

Michael J. Nook  
San Diego, CA

Editor: I'll forward any possible solutions on to Mr. Nook that we receive, as well as publish them in an upcoming issue. I assume that the reference to a "printer" means the Times 1040 thermal printer. C'mon programmers!

## Sir Clive's Confessions

Entrepreneur extraordinaire, Sir Clive Sinclair, has ended several months of silence, following the sale of major interests in his company that pioneered low-cost home computers, to Amstrad Consumer Electronics PLC. Last week, Sir Clive came out of seclusion and spoke with the British press. The following comments were taken from two separate interviews relating to questions posed about Sinclair microcomputers.

### Sir Clive on the Spectrum—

"The Spectrum was and still is an enormous success although it is showing it's age a bit. I was rather surprised to see it turn out to be a games machine...we really knew very little about that side of the market."

### What about the QL?

"I think the QL was an interesting idea...a sophisticated machine, but in the end it didn't work out very well, as we had originally anticipated. The market for a 68000-based micro wasn't as big as research led us to believe. The QL had teething troubles early on. The truth was, that when the project came up, that later became the QL...I wanted to do the whole thing on the Z80 microprocessor, but most of the engineers and Nigel [Nigel Searle, former Sinclair Marketing Director] wanted to do it on the 68000. I couldn't see the point of that because it seemed to me you were paying a lot of money for the chip and I couldn't see what you were going to be able to do on it that you couldn't already do on the Z80. Sure it was a bit faster in principle...but it wasn't that in practice. Looking back there was no need to go for 68000 technology. We just haven't found a way to use the 68000 that gives any extra benefit to the customer."

### Sir Clive on the Microdrives—

"The bad press the Microdrives received was unfounded, I'd defend them absolutely. I think they were a marvelous approach to low cost mass storage. Their technology and application should be studied further."

### What about the Pandora?

"I want to go ahead with the Pandora project. It will not be competitive with either the Spectrum or QL, as we have lost all rights to their technology. I think it will be best in a way, as it opens the door for a new and customized operating system. Most of the portable computers available are compromises of one sort or another. To me, a portable computer must be totally portable and no trouble to use."

### Amstrad director, Alan Sugar?

"I hope to keep in touch with Alan Sugar, and I like him very much."

### Sir Clive's future?

"I am most happy right where I am now...tinkering with new projects for the future. To be perfectly honest, I have never felt comfortable playing the business manager role."

## What's In A Name?

Early in 1983, advertisements for RANEX INTERNATIONAL appeared in the national Sinclair magazine SYNC. Rames, of Utica, Michigan, sold external Z80 keyboards, RAM packs, among other items. With the advent of the Z8000, the company expanded further, under the direction of general manager, Scott Duncan. They obtained the exclusive marketing rights to the 386000 TDS word processor from Tamsan Software to Great Britain. Later on, after Times belted out of the U.S. computer market, Rames imported a Spectrum disk drive interface for the T/S 2068 and coupled it with quad drives as a package...it was called the "Millennia E". An "overkill" with the quad drives later led to an Amdek 3" disk system.

Then in February of 1986, Rames announced that they were no longer supporting Times computers or their disk drive system, but instead opted to carry the American version of the QL from Sinclair Research plus peripherals and software. They changed the name Rames International to FOUNDATION SYSTEMS. About the same time, they moved from their original facilities to an address in Washington, Michigan. A new public relations manager wrote a review on the QL, which appeared in the February issue of Computer Shopper.

When A+ Computer Response of Boone, New Hampshire, took over distribution of the QL in the U.S., Foundation Systems became a fully authorized dealer.

In June and July of this year, several readers of TON wrote, requesting assistance in contacting Foundation Systems, because QLs they had sent for were not being delivered. What TON learned was that the distributor, A+ Computer Response was receiving similar complaints, and that Foundation's phone number had been disconnected. A spokesperson for A+ informed TON that Foundation was no longer an authorized QL dealer.

By surprise, in August, TON was informed that once more, another company had surfaced using the same Washington, Michigan address...it was called MATRIX TECHNOLOGIES. The company took a small ad in the September 1985 issue of Family Computing Magazine. The new product? IBM PC clones for \$399.

## NOVELSOFT Emerges As Premier TS Software House

If one were to imagine what the ideal Times/Sinclair software company would be like, some attributes might include a full time office, open for customer's questions and support, professional products with "complete" documentation at a fair price and prompt order processing. NOVELSOFT of Toronto, Canada, may come close to filling the bill.

The reviews are out, and the word is spreading fast about recent software releases from Novelssoft: TIMMACHINE, quite possibly the best BASIC Compiler ever for Sinclair computers; ARTWORX Version 1.1, a sophisticated graphics package; and a brand new release called THE MORRI, which is a collection of useful mini-programs. All of these releases are on their way to achieving "hit" status in the T/S community...a small accomplishment that would blush next to the giant software houses, but a respectful one never the less.

According to Novelssoft, Senior Partner, David Ridge, the company was started to promote their programs in Great Britain. They have had some interested U.K. software publishers, but the current situation in England with Amstrad and the Spectrum, has put a halt to most major investments. The whole industry is waiting to see what will happen next.

Novelssoft has generously included a version of their popular programs on one side of the tape for the Times/Sinclair 2068. The other side has a Spectrum version of the program.

# Product/Dealer News

Sinclair telecomputing experts Ed Grey and Dave Clifford (G & C Computer Products), based in Southern California, have officially announced the release of SPECTERM-64 terminal software and the Z-SI/O card, an RS-232C interface for the T/S 2068. The SPECTERM-64 software will operate on a Spectrum-emulated T/S 2068. A stock 2068 version is planned for a later release. The terminal software includes a true 64 column display, uses XMODEM protocol for file transfer, will transfer all control characters including ESC, has a 35K buffer, and is fully compatible with the T/S 2050 modem and the Sinclair Microdrives. SPECTERM-64 comes with extensive documentation, and a special version configured to run the Z-SI/O card. The card was designed and manufactured by Dave Clifford, who also developed the Z-LINK Spectrum interface in 1985. Z-SI/O includes a standard RS-232 connector (DB 25 pin), and a full buss feed-through. It will drive a wide range of peripherals, including any 300 and 1200 baud modem (including Hayes compatibles) with the 2068. Note: SPECTERM-64 can be overlaid to run almost any RS-232 I/F currently available for the T/S 2068, including the circuit featured in the March/April 1988 issue of TDM. SPECTERM-64 also has built in 1200 baud compatible routines. Price for SPECTERM-64 is \$30.00 plus \$2.00 S&H in U.S. (Canada add \$2-U.S.funds). The Z-SI/O card is \$75.00 plus \$3.50 S&H (Canada add \$2). Additional information can be obtained by writing Ed Grey or Dave Clifford at: PO Box 2186, Ingewood, CA 90305, (213) 789-7406 or 516-6648.

Another good value for your T/S modem-ing dollar, is the LOADER V software package, by Kurt Casby (25 Battle Creek Court, St. Paul, MN 55119). It is an enhancement for the 2068, 2050 modem and MTECM (Smart II) terminal software. Loader V is the final suite in the "Loader" series previously offered by Mr. Casby. Loader V features: An additional 20 number dialing directory, an auto-repeating dialer capability to load Mtecm buffer with any standard "bytes" file, Loads text files created with either TASMOR II or MSCRPT into Mtecm's buffer, an XMODEM protocol, among several other user-friendly features. The program on cassette with complete documentation is priced at \$9.95.

Robert C. Fischer, producer of PRO/FILE EXTENSIONS, T/S GRADER, WORD PUZZLER, and WORD GAMES, has changed his address and can now be found at Rt 2, Arizona St., Emerson, GA 30137.

QL SCREEN DUMP is a utility program that allows the user to dump items produced on the screen in SuperBASIC, to any Epson-compatible printer. QL Screen Dump is written in fast, compact machine code and reportedly takes up less than 3/4K RAM. The program is available for \$24.95 from E-Z KEY, Suite 75, 711 Southern Artery, Quincy, MA 02269.

The English Micro Connection of Newport, Rhode Island, closed its doors for good on August 5th, due to some "serious health problems". EMC owner and operator, Bob Dyl was an early supporter of TIME DESIGNS, and gave TDM several news items of Sinclair computing in Great Britain, obtained from several trips that Bob made to England. The editorial staff of TDM wish Bob a speedy recovery and best wishes for the future.

Knighted Computers, 707 Highland St., Fulton, NY 13069, (315) 593-8219 has obtained some stock and items as a result of the closure of EMC. For information and prices on some interesting QL goodies, write to either Ray or Joe at Knighted.

Stan Lemke, a regular columnist for TDM, and owner of Lemke Software Development (2144 White Oak, Wichita, KS 67207), has done it again. His new program, COLOSSUS, looks like a winner. The program is a graphics banner designer package that allows the user to create a banner 32 screens long, with a variety of font styles/sizes, and add low-resolution graphics on, over and around the

banner text. There are also extensive editing features. Printing is to either 2040 or a full-size printer, with modifications by the user for specific printer/interface combinations. A bonus feature of Colossus is a "movie animation" function, that flips a total of 32 screens at the rate of four screens per second for an interesting effect. The program is available on cassette, with full documentation, and a sample animation file, for \$19.95 (postage included).

HIGH RESOLUTION programming for ZX81-based micros, is the trend, up at Fred Nachbaur's workshop (address: C-12 Mun. Stn. Group Box, Nelson, B.C., V1L 5P1 Canada). We're not sure exactly how he does it, but we do know it takes a lot of memory. Fred's latest offering is a high-res maze adventure game for the Timex 1500 with either a 16K RAM pack or 8K Hunter Board (purchasers must specify which version). A later version for the ZX81 and T/S 1000 will be released. DUNGEON OF YHIR, is 100% machine code, with monsters and multi-levels. Price is \$24.95. Other, hi-res programs are available.

## Users Group Update

T/S User Group Correspondents: Send us your group's address and we will list it in an upcoming issue. We will also print announcements, special events and User Group news (if it's brief).

Anyone interested in forming a T/S User Club in the Leesburg area of (Central) Florida, should contact Warren Fricke, 225A Highland Dr., PFL, Leesburg, FL 32788 or phone (904) 589-2729.

Timex-Sinclair User Club, c/c Mr. Richard K. Norek, 188 St. Felix Ave., Cheektowaga, NY 14227.

Timex-Sinclair User Group, 1545 Alta Vista Drive, Apt. 1402, Ottawa, Ontario, Canada K1G 3P4.

Over 45 guests attended the Grand Opening and Open House at the new facilities of Time Designs Magazine on August 30. Attendees included some members of CATS and PATS users groups of Oregon, as well as a number of subscribers from the Northwest. Highlights included a Q&A demonstration by TDM writer, Mike de Sosa; preview of LIGHT SHOW 2000 (a program featured in this issue) by the author Michael Carver; Sinclair merchandise was displayed and sold by RMG Enterprises; and there were door prizes and refreshments. The day was enjoyed by all those who came. Tim Woods, Editor of TDM, announced that the Open House would be an annual event.

# LIGHT SHOW

Revox (a manufacturer of "Top-of-the-Line" audio equipment) recently introduced a cassette deck with an RS232 port, allowing control of the unit via a computer. For a mere \$1,400.00, this cassette deck could be yours. LIGHT SHOW 2000 will turn the tables on the Revox: for about 1/100th of the cost, LS 2000 is a program which will allow your cassette deck (or any other musical source) to control your computer.

LS 2000 will poll the ear port of your TS 2068 and decipher any pulse detected into one of four tonal groups (the shorter the pulse, the higher the note). Depending on the tone detected, a corresponding color pattern will be displayed on the screen. The user has control of the tonal groups, colors, duration of display and the speed at which the tones will be read. This flexibility allows one to "view" the same piece of music in a multitude of ways, or to tailor the program to a certain musical selection. LS 2000 comes with one preset Set-Up to "display" music and provides for four user-defined set-ups.

## LS 2000 HOOK-UP

To use LS 2000, some means of providing a musical source to the computer must be used. There are several ways of accomplishing this, some more flexible and preferable than others. The simplest means is to hook up a wire directly from the speaker of a stereo system to the earphone jack of the TS 2068. (IMPORTANT: Do not hook up more than one channel of a stereo system as this may damage the stereo amplifier.) This can be done by running speaker wire from the rear connectors of a speaker (or from the speaker output of your stereo) to your computer. Do not leave the speaker disconnected from the amplifier. A phone jack can be attached to the ends of the speaker wire and plugged directly into the computer's ear jack. Or alligator clips can be used to make a connection to your computer patch cords. The drawback of this approach is lack of control over the signal going into the computer. If the music is played at a low volume, the signal may be too low. Conversely, "Heavy Metal" from a 200+ watt system at full blast may cause your 2068 to become light dust.

If the tape recorder you use with the 2068 will play through the earphone jack while in record mode, it can be used to feed the sound source into the computer. A similar wire will be needed to plug into the microphone jack of the recorder, as previously discussed. Run

a patch cord from the earphone jack of the recorder to the earphone jack of your computer. Place a tape in the recorder and set it to record. If you opt for this method and plan to play your music at medium to high volume, I would suggest placing an attenuator in-line between the microphone input and the speaker wire from the stereo. (An attenuator may be obtained from Radio Shack for \$1.99 -- Part #274-300). This part has an RCA jack for input and a regular mic/earphone jack for output. This will help prevent distortion and possible overloading of your recorder. The preferable choice is to use Radio Shack's mini-amplifier (\$11.95 -- Part #277-1008). The hook-up is the same as with the tape recorder. This method will allow control of the signal volume going into the computer. Once again, use an attenuator, if the musical source is to be played at any volume. If LS 2000 does not respond to input while using the attenuator, the attenuator should be removed. (NOTE: This mini-amplifier can be used to boost the output of computer tapes you may have difficulty loading. It also can be used to amplify BEEP output from your computer.)

A "walkman" type cassette player can also be used to supply music to the computer if it has two headphone jacks. Use one of the jacks to run a patch cord to the computer.

## USING LS 2000

Upon running LS 2000 you will be presented with a main menu (see example 1). "ENTER LIGHT SHOW" (Option 0) will pulse color patterns on the screen based on the input through the ear port. (NOTE: To return to the main menu while in this mode, press the "Q" Key.) Option 1, "SYSTEM SET-UP", will provide a second menu allowing the user to select 1 of 5 permutations of LS 2000 (see example 2). The current set-up is highlighted via BRIGHT. (NOTE: If any of the parameters are changed, no current set-up is shown.) This menu also allows viewing of the parameters for any compiled set-up (Option V). Option 5 will define a set-up based on the current setting (i.e.; mode, colors, tone, pulse, tempo). The user is prompted to choose a number to be compiled (2-5) and for a name. When this new definition is compiled, it then becomes the current set-up.

From the main menu, the user can create different set-ups or settings. By changing any of the various options (2-5), LS 2000 can be customized to any musical input or user preference. The best way to learn what each option does is to experiment. After changing an option, one can view the results by "Entering Light

by Michael E. Carver

Show". Each setting option is provided with prompts and explanations from within the program. (See Sample Set-ups for examples.) Depending on the type of music or the quality of the input (dynamic range), one may need to retune the tone control. Tone 0 is the highest tone range, Tone 3 the lowest. The number assigned to a tone is the upper limit at which LS 2000 will produce a pulse.

The Save/Load option allows the saving of favorite compiled setting to tape for later retrieval.

## BEHIND THE SCENES

When the TS 2068 is loading a program from tape, it reads through the ear port (port FEh) the signals recorded on the tape. The data needed to send the program is stored in bit 6. If the bit is set ("1") the frequency of the signal is 1020Hz, if it is not set ("0"), the frequency is 2040Hz. The frequency is determined by the length of the pulse detected. Port FEh also uses bits 4-0 to poll the keyboard. By sending out this port, BORDER colors can be controlled (bits 2-0) or a BEEP can be triggered through bit 4. When a program is sent to tape, bit 3 of port FEh is used. The threshold of the ear port is 23kV, with the input being 4-10 volts p-p.

## KEYING IN THE LISTING

Carefully key in the BASIC Listing. After you have typed in the program, SAVE the listing to tape before running the machine code loading routine. To load the machine code portion, ENTER as a direct command [RUN 9000]. This portion of the program will POKE the machine code into its proper address. It also checks for various typing errors and will provide instructions in case an error was detected. After the machine code has been placed in memory, the program will set up the User Graphic "A", delete this portion of the program from the listing, and prompt you to SAVE & VERIFY the completed program along with the compiled code. After VERIFYING, the program will self-run. Go ahead and try it out. NOTE: In Line 3, the A in quotes is typed via GRAPHIC mode [Caps Shift/9] [A] [Caps Shift/9].

### SAMPLE SET-UPS

Name	Mode	Tone Limit				Timing Course/Fine	Pulse
		80	81	82	83		
Default	1	240	208	192	160	10/284	1/1
Laid-Back	1	240	208	192	160	10/1	12/254
Speed-O	0	216	208	192	160	2/100	1/1
Raiser	0	216	208	192	170	1/1	10/174
Ripple	1	216	208	192	170	3/100	10/174

### BASIC LISTING

Lines	Notes
1-3	Sets up the screen with the patterns to be "pulsed" by LS 2000. NOTE: Even when the screen looks blank, the complete pattern is still on the screen, as INK has been set the same color as the PAPER. The machine code simply sets the ATTRIBUTES to the proper INK color. Check this out by changing the INK color in Line 1 to "P". Add Line 9 STOP. As direct command <00 to >.
10	The POKE sets lower case only. This is the USER call for the machine code portion of LS 2000.
100-120	Contains data for line/column placement of LS 2000 graphics.
130	Contains data defining USER Graphic "A". Can be redefined to any character or pattern.
140-160	Sets up and defines variables for LS 2000 BASIC. Line 150 Contains data for Default "Set-Up"
2000-1010	Main Menu
2000-2100	System Set-Up Menu
2300-2340	Compiles current parameters as a defined Set-Up
2300-2320	POKEs parameters into Machine Code as current Set-Up. (See Line 2999)
2400-2430	Displays parameters for a compiled Set-Up
2999	Contains addresses of Machine Code which hold parameters for current Set-Up
3000-3030	Option 2 -- Set Mode
3100-3170	Option 3 -- Set Colors
3200-3280	Option 4 -- Tone Control
3300-3390	Option 5 -- Pulse Control & Option 6 -- Tempo Control. NOTE: This subroutine is shared by both Options. Control of Option is decoded by variable A: IF 5 THEN Pulse Control, IF 6 THEN Tempo Control
4000-4200	Save/Load Option. Also allows for verification of SAVE and LOAD without breaking the program with a RUN Error Report.
6000-6030	Subroutine to scan keyboard for input
9000-9420	Routine to POKE Machine Code into memory
9999-9999	Routines to SAVE and LOAD LS 2000

The author will provide a copy of this program on tape for \$4.00 (includes shipping). Please send a check or money order to: Michael E. Carver, 1016 NE Tillamook, Portland, OR 97212. Please specify "Light Show 2000".

The WJDUP Co.  
presents

TOURIST C

## BANK SWITCHING IS HERE! BE READY FOR IT.

Tourist C is really an extended bank switching disassembler and SPY program residing in BASIC. It uses machine code located above "COPYUP" in the machine stack. Printing to the EB&B is not usually desirable, so a universal interface is included. When used, the appropriate kernel is loaded into the printer buffer. Because this is an "overlay" it does not interfere with any usage by other banks or peripherals.

To help convince you of the great features of this program, send us no more than 50 bytes of any code you like and SAVE. The WJDUP Co. will return a disassembly of that code and more info about TOURIST C. How's that for bait? Try it.

The WJDUP Co.  
112B Herrifield S.E.  
Grand Rapids, MI 49507

Program TOURIST C  
Order # T823P868  
Price \$32.50 inc P&H

# WINKJET 1

WINKJET 1 lets you use ALL the features of your OLIVETTI PR3300 ink jet printer. PIONEER is a MENU built universal interface. Use your TASHMAN, AERCO, or home brew parallel physical interface.

LPRINT speaks fluent extended ASCII, and is adept at the PR3300 GRAPHICS dialect.

WCOPY dumps the screen to the printer in normal size or 200M. LIST is supported in high resolution graphics using WCOPY.

WHAT YOU SEE IS WHAT YOU GET!

WINDOW dumps part of the screen in variable length lines up to 110 characters per line.

Its default configuration prints the lower two screen lines as 64 wide.

The WJDUP Co. word processor/data base program TypeLot uses WINDOW to prepare ads like this and the one to the left.

				ing to addresses in
				attribute file of
				graphics for tone 3
				same as above but for
				tone 2
				same as above but for
				tone 1
				same as above but for
				tone 0
				variable for mode

NOTE: As only the pattern for Tone 3 has 16 graphic locations, some locations have been provided in the other tables to bring their total up to 16. This offset = start of attribute file points to the Printer Buffer. The reason for maintaining a count of 16 for all tones was to produce a simpler code and to provide a similar timing for displaying all tones.

## Colossus

Welcome  
to Home

Just  
Married

It's  
00000000

COLOSSUS is a graphics-banner program. Now you can mix banner-size TEXT with banner-size graphics PICTURES. Route your graphic banner to the 2040 thermal printer or a full size printer (you must supply your own customized Zprint-80 printer driver code.)

### Specifications

Banner size: 24 rows x 1024 continuous columns (32 screens long)

Font Type: Standard Modern, Italic, Bold, Load Font (Chancery included)

Font Size: 8 x, 14 x, and 24 x normal

Functions: Scroll Forward / Backward  
Insert/Delete Column  
Insert/Delete Row  
Copy/Save Segment  
Load/Save Banner Data  
32 Screens, Low Res Animation

### Output: 2040 Printer

Full Size Printer (Z-Print 80  
printer driver required)  
(Print from any column)

## PIXEL SKETCH And GRAPHICS EDITOR Version 2.0

Reviewed by Duncan Teague

What if Michelangelo and Leonardo da Vinci had owned some good graphics software? Would they have utilized a computer for their creative efforts? Would the Sistine Chapel be covered with fanfold paper? Would the Mona Lisa be stored as electrons on a disk instead of pigment on a canvas?

Those gentlemen were the masters of their media. Unless you have a comparable skill with palette and paint brush, maybe you'd better rely on joystick and keyboard. PIXEL SKETCH AND GRAPHICS EDITOR Version 2.0 employs both.

PS/GE lets you create, edit, and label original graphics and modify, merge, and analyze existing screens with electronic tools. Some of the editing functions on PS/GE are found in Apple graphics software like Mouse Paint and Dazzle Draw. PS/GE even provides some functions the 128K Dazzle Draw doesn't include.

PS/GE operates in three somewhat compatible modes: standard color, extended color, and high resolution. Mode can be selected once the program has loaded. The standard color and extended color modes can be electronically switched at will while you're working with PS/GE. The high resolution mode must be maintained once it is selected.

In the standard color mode, one ink color and one paper color are allowed in each 8 pixel by 8 pixel character position. The brightness and flashing attributes may be on or off.

In the extended color mode, PS/GE creates eight "elements" within each character position. Each element is 1 pixel high by 8 pixels wide. One ink and one paper color and one bright and one flash attribute are permitted in each of these elements.

One screen character could thus be printed with 8 ink and 8 paper colors with alternating bright and/or flashing horizontal elements. In this mode it's possible to create new colors on the screen by juxtaposing the appropriate ink and paper colors. The manual suggests using red ink on green paper to make brown.

The high resolution mode amazes me. Although the hardware limits you to one ink and one paper color on the screen at any time, the software extracts the finest detail possible from the T/S 2068: 612 pixel horizontal resolution. All three modes offer the standard 176 pixel vertical resolution.

The incompatibility between modes is seen in the input and output routines. A standard mode picture is saved or loaded as a standard SCREENS: 6912 bytes at address 16384. An extended color graphic is saved or loaded as two files, each having 6912 bytes. One file at 16384 holds ink (pixel) and paper (no pixel) data. A second file at 24576 stores extended color and attribute data.

A high resolution display also saves or loads as two files. They extend the identical length and reside at the same starting addresses as an extended color screen. The first records the odd number column data, the second, the even number column data. The program tape includes a utility, PS/GE-32/64, which will convert one or two standard mode screens into a high resolution screen. (The listing for this utility appears in the March/April '86 TDM.)

If you've ever used MacPaint or a Macintosh or Mouse Paint on an Apple II, you'll be right at home with PS/GE. Although the former programs employ a mouse for input instead of a joystick, they offer nearly the same drawing, text, and editing functions.

The drawing functions of PS/GE are as follows:

PS/GE 2.0  
employs 2  
different  
character  
fonts  
Standard &  
Chancery  
and uses 3  
modifiers  
Bold Bold  
Modern  
Modern  
and  
Italics  
Italics  
plus their  
INVERSES!

Mona Lisa courtesy of "Art For All Ages" by R. Conlan for Games to Learn By. I loaded the screen, mirror imaged half, block-copied, and block-erased. Then I added the text balloon.

1. Plot and Erase (free hand sketching and erasing);
2. Draw (disconnected) and Connect (-ed straight lines);
3. Circles; 4. Draw Arcs; 5. Fill/Shade (with textured patterns); 6. Paint (with solid colors); 7. Text (labeling).

The ink and paper color and the flash and bright attributes can be changed at will. Cursor speed can be adjusted from moving one pixel at a time to four times that rate. Cursor speed could be further changed by altering the program listing.

The plot (sketch) command is controlled by the fire button on the joystick. The joystick is also used to select other functions from a menu screen accessed by pressing the ENTER key. Keyboard commands can also change the cursor speed and activate the erase function without having to leave the drawing screen.

Two status lines at the bottom of the screen provide a constant readout of the cursor's position, whether the plot and/or erase functions are in use. The cursor's coordinates are important to know. Most of PS/GE's editing functions operate optimally only when the edges of drawn figures coincide with the normal character position boundaries. I'll explain later.

The text you use to label your creation can be the ordinary system font, or you may load an additional font from the program tape. The extra font is called "Chancery". It looks like it flows from a calligrapher's pen. You can alter either font from the menu. You may choose bold, modern, and italic versions of either the system font or the Chancery font at any time.

The editing functions of PS/GE are operated within an adjustable, but not elastic, window. PS/GE's window moves 8 pixels at a time. Window boundaries are always aligned with the edges of the normal screen character rows and columns. If a portion of an area to be edited extends beyond a normal character row or column, the editing window must be large enough to extend to the next row or column boundary.

Here is a list of PS/GE's window editing functions: 1. Block Copy (cut and paste); 2. Block Erase; 3. Block Rotate (90 degrees clockwise); 4. Mirror Image (horizontal only); 5. Inverse (exchange ink/paper); 6. Wide View (shrink); 7. Zoom (enlarge); 8. Digitize (analyze like a WGS-help create sprites!); 9. Merge (a portion of one screen with another).

# Mirror Image Butterfly

Drawn with PS/GE 2.0

The butterfly is my own drawing using PS/GE. I created the left side, filled and painted, and then mirror imaged it. Then I added the text.

When you select any of these functions from the menu, a window appears on the drawing screen. The window's size can be adjusted in one dimension at a time by using the unshifted arrow keys. The "S" and "L" keys will make the window smaller or larger by changing its height and width simultaneously. The joystick places the window in the appropriate position.

After using any of the editing functions, you'll have a chance to reconsider. A "SAVE?" prompt will appear, and you may "undo" the last procedure by responding with any key except "Y". The drawing functions, except Plot, Erase, and Text, can also be undone.

Hard copy can be obtained of any screen in any mode. Only the ink/paper pattern is reproduced. Colors are not represented by different dot patterns as in Tascopy or Z-Print 80. The screen can be printed on the 2040 printer or in small and large sizes on 80-column printers.

If you want to use an 80 column printer, you'll become more familiar with your printer's manual than you used to be. You'll need to know how to adjust the line feed pitch and how to send the appropriate commands for bit graphics.

My printer has to know how many bytes will follow the bit graphic command. The correct number for my C. Itoh 8010 is 256 in the standard color mode, and 512 in the high resolution mode. Those numbers had to be doubled for the large printout.

To make the large printout of a high resolution mode screen (1024 bytes per line), fit on my printer paper, I had to set the printer's DIP switches for pro-

portional characters. This gives a print density of 1280 dots per 8-inch line, slightly more than required for this mode.

If your bit graphics mode prints each line upside down, as mine did, there's a simple solution. Alter the program's machine code with the following POKE's, which are courtesy of program developer Stan Lemke:

Memory	Old	New
Address	Value	Value
42019	249	193
42923	241	281
42936	249	193
42961	144	120
42966	144	120

AERCO FD-68 owners will easily be able to convert PS/GE to disk. The utility for converting standard screens into high resolution screens is another matter. PS/GE-32/64 uses OUT 255,0 and OUT 255,54 to alternate between 32 and 64 column modes. The FD-68's OUT 244,1 command interferes. Disk access must be switched off with OUT 244,0 before performing the conversion process. Loading two screens is much more difficult. I used short machine code routines to store one at 40000 and then recall it for conversion.

I really enjoyed using PS/GE. Cursor movement is slow, especially across the 512 pixel-wide high res screen, but the sophisticated editing functions surpass those of any other T/S 2068 graphics program I own. The functions for creating and editing screen segments, merging one screen with another, converting standard mode screens to high resolution screen, and printing out with excellent dot density exceed my present ability to exploit them. But I'm learning. My joystick finally has something to do besides play games.

PIXEL SKETCH AND GRAPHICS EDITOR Version 2.0 is available from Lemke Software Development, 2144 White Oak, Wichita, KS 67207. The T/S 2068 program comes on a cassette with users manual for \$19.95 ppd. A joystick is required.

## TIMACHINE — A BASIC Compiler

Reviewed by Michael E. Carver

Deja vu! That was my first thought upon opening the large envelope from editor Tim Woods. Let's take a trip via H.G. Well's time machine by setting the controls to travel back in time one year. Exactly one year ago, I was asked to review a BASIC compiler for the T/S 2068 called ZIP (Sept/Oct '85 issue of TDM). Back to the present! I now have the task of reviewing a new BASIC compiler for both the 2068 and Spectrum (two different versions on the same tape). It's called TIMACHINE.

First, a short review. BASIC is the resident ROM language in the Sinclair machines. BASIC is a language we humans can easily use to make the computer and its processor perform a desired task, and is a fairly effortless language to learn and use. It is also a fairly forgiving language, especially with the help of Sinclair syntax and error checking. The trade-off for this simplicity is a lack of speed and flexibility. The actual resident language of the Z80A CPU (the main brain of the Sinclair machines) is machine code, also known as assembly language. This "language" is composed of about 50 different instructions, though most have many vari-

ations. The advantages of machine code include fast execution, efficient use of memory, and freedom from the dictates of the Operating System. The other side of this coin are the following disadvantages: programs are hard to understand and follow, a simple manipulation of data may involve many complicated steps, real-number calculations can be difficult and it can be very unforgiving. Programming in machine code can involve extensive study of the machine, books and tables, developing tools (assemblers and monitors), and, of course, patience.

Enter the BASIC compiler, which attempts to marry the advantages of both BASIC and machine code, while trying to avoid their drawbacks. TIMACHINE is the best compiler I have seen to date for the Sinclair Z80 machines. Timachine will compile virtually all of the Sinclair BASIC commands into a much speedier program. This compiler is quite different from others I have seen in both speed and versatility. Where many compilers only allow the use of integers (whole numbers from -32768 to 32767 or 0 to 65535), Timachine will allow the use of real numbers (decimals and numbers far larger or smaller

than 36-bit numbers). There are also floating-point (or real number) compilers available for the Spectrum, but unlike Timachine, can not compile both integers and real numbers, and run only 3 to 5 times faster. Timachine allows the user to specify which numbers are to be real or integers, thus greatly speeding up performance when doing integer mathematics.

Unlike other compilers, Timachine also allows string arrays and defined functions and 2-dimensional arrays, along with many other commonly used BASIC commands. Because it allows floating-point mathematics, one can also compile trigonometry functions (TAN, COS, ACS, SIN, etc.). In fact, according to the manual, Timachine will support all but the following BASIC commands: CLEAR, CONTINUE, ERASE, FORMAT, LIST, LISTING, LOAD, MERGE, MOVE, NEW, RESET, RUN, SAVE, VERIFY, FREE, ON ERR, and VAL#. A few other commands may have some limitations connected with them, i.e., RESTORE, GOTO, and GOSUB must be followed with a valid line number and not an expression or variable; an array can only be dimensioned to one set length; a defined string variable may not be later dimensioned; VAL# is not supported.

Speaking of the manual, I must compliment Novelsoft and Cameron Hayne [the author of the manual and program] for providing an extensive and easy-to-follow manual. The manual contains 52 pages of excellent step-by-step tutorials (sample programs included on tape), thorough explanations of commands and directives (even explaining how to obtain certain Sinclair keywords), detailed notes on how the compiled code handles certain BASIC instructions, clear and helpful hints, definitions of Error Messages, a list of helpful POKEs, a memory map, and a list of the runtime routines.

Timachine is loaded into the memory location normally reserved for BASIC (right after the system variables) with the normal 2058/Spectrum memory map shifted upwards to allow for BASIC programs. There is approximately 27k available for a BASIC program (30k on the Spectrum). Once loaded into the computer, Timachine is completely transparent. One can LOAD or type in a BASIC program and RUN it as if Timachine was not in memory. Timachine is accessed through direct commands prefaced by an asterisk, "\*" (e.g., [F3] will compile a BASIC program). In fact, the only time Timachine makes itself apparent (except for less available memory) is when the trace (an interrupt-driven program) is on. While running a BASIC program, the trace will log

and type the program variables every 1/60th of a second (1/60th on the Spectrum) and provide a listing of the variables with their type (i.e., real, integer or positive integer) and the length of string variables. This is a very helpful tool. There is a limit of 255 simple numeric variables, whose name can be any length and the standard number of string variables.

Directives to the compiler (instructions) are included in the actual BASIC program in ROM statements with an execution point, "!", following the REM (e.g., 10 REM ! OPEN # will start compiling at this point). Some of these directives are instructions where to halt or re-start compiling (allowing access to BASIC or other machine code routines), maximum length allotted to a string variable, and setting types of numeric variables (i.e., real, integer, etc.). One can direct a listing of the addresses for the runtime routines and the machine code variables used by the compiled program. Also, a listing of the execution addresses for individual compiled BASIC lines can be obtained. One can specify the address at which the compiled code will reside, giving flexibility in locating ones own machine code or BASIC routines.

Learning to use Timachine is simple, but practice and study is needed if one plans to master its uses. Simple BASIC programs are easily compiled into fast-running programs. An understanding of real numbers and integers is needed to obtain maximum and interesting results. When real numbers interact with integers, interesting, but usually undesired, results can occur. While testing Timachine, I used various BASIC programs I had already developed and debugged. During the first pass, Timachine checks the BASIC for any unsupported BASIC commands and provides clear Error Messages displaying the offending BASIC line, usually with a flashing "I" cursor marking the part in question. The next pass is a dry run to fix the amount of memory needed for the program. The last pass is a final compilation. The last pass is the actual creation of the machine code. The user is provided with information on the length of the compiled code, amount of memory allocated for variables, length of the BASIC program, and instructions on how to save, load and run the compiled code. This complete compilation process is quite easy. Timachine compiled the demo program included with the ZIP compiler in 9 seconds compared to the 31 minutes taken by ZIP (see Sept/Oct '85 TOW, pp. 18-19). I was able to compile most of my test programs satisfactorily, with only minor modifications to the BASIC. However, the one larger and complicated of the BASIC programs proved to be too convoluted to simply modify. I did not have time to fully test this program, but feel it would require a major rewrite to obtain proper results via Timachine. If the program had originally been written with Timachine in mind, I see no reason it could not be easily compiled.

As the compiled code is in machine code, it can be unforfeiting and provide undesired results. In BASIC, "PRINT N (X)" will print N(1) if N=5, where the compiled version will attempt to print N(10). Another problem I encountered dealt with FOR/NEXT loops. In BASIC, one can leave a FOR/NEXT loop, jump into the middle of another FOR/NEXT loop using the same variable and upon execution of NEXT (X), resume operation at the start of the second loop. However, in machine code the continuation is at the start of the first loop. There are many routines (machine code routines used by the compiled version to execute selected operations) which use extensive ROM routines. This allows for simple conversion and efficient use of memory, but can slow down performance. When these routines are used, the improvement in speed is slight, (e.g., CIRCLE, DRAW, COS, etc.). It is up to the user to develop a BASIC program that will utilize a more efficient compiled version. This will come with practice and experience, though knowledge of machine code will be helpful. One can use Timachine as a tutor on how to write their own machine code utilizing ROM resident routines.

Timachine is the most comprehensive, flexible compiler I have seen for the Spectrum or TS 2068. It is always a pleasure to encounter a program of this class, and I must applaud Cameron Hayne for obtaining so much from our humble Sinclairs. Depending on the programming skills of the user, one can compile fast and efficient machine code programs, though not necessarily using less memory. It is a program that will allow the novice BASIC programmer some degree of success, while allowing the more experienced programmer greater flexibility. One should not expect to produce amazingly impossible feats from this product, as these usually come from direct manipulation of the processor via ones own machine code. One will be able to produce effects that are available in BASIC, but a speed that will greatly enhance them. In last year's review of ZIP, I stated that one should choose a compiler based on its limitations. Well, Timachine has few limitations and is a quick and comfortable program to use. Will this be the "last word" in compilers? I don't know. Let's see our "time machine" for one year into the future.

TIMACHINE is available for \$19.95 + \$3.00 S&H (U.S.) from Novelsoft, 106 Seventh Street, Toronto, Ontario, Canada M5V 3B4, 416/259-8692.

## 2068 KEYBOARD OVERLAYS

**QUICKKEY™**  
2068

Put commands at your fingertips!  
Durable glossy, smooth free plastic clock out to fit your keyboard.

# LARKEN TS1000 Disk Drive Interface

Reviewed by Sean Wenzel

I am sure all of you have thought about the speed and reliability that a disk drive can offer, but it just cost too darn much or the reviews said it wasn't much of a DOS, it was more like a "seem-dos" (in lower case), and you had to be an electronics engineer to put the thing together, ect...that is why you didn't go ahead and get one.

Well there is no excuse now, because Larry Kenny of Larken Electronics has come out with a disk drive interface which is not only inexpensive, but also has a real live DOS!

O.K., so you order the drive interface...what do you get? I ordered one, and when I found it at my door, I quickly ran inside and carefully opened the package wrapped in cardboard and discovered a circuit board about 3 1/2 inches, a power connector for the disk drive, a disk, a ribbon cable for connection to the ZX81 and one for the drive, and a manual. I opened up the manual and found out that I now needed to buy a power supply and a double sided IBM compatible disk drive. The power supply must provide 5 volts and 12 volts each, at a couple of amps. The drive and power supply are easily obtained at almost any computer store. When I got the drive and power supply, I hooked them up according to the diagrams in the manual and powered up the computer and watched for smoke...there was none! Then I did a RAND USR 14336, then LOOKS appeared on the screen, and I formatted a disk by typing FORMAT, and the drive whirled and "clunked" and completed the format successfully. I then sat down and read the manual and found out that LARKEN DOS is extremely flexible and easily lends itself to modification by the beginner who uses BASIC, through to the advanced machine code tacker. All of the locations and a brief description of useful routines in the ZX DOS EPROM are given in the manual. If you wish to convert an auto-run BASIC program, you can just load it normally and break into it (or if it is unbreakable, use RAND JIB 337 -- auto break on load), and where the save line is, just put RAND USR 14336 followed by a REM statement containing the command (e.g.: REM SAVE "NAME.BI"), then GO TO the USR 14336 line and the program will auto-save and run.

You can have up to 52 files per disk and the maximum file size is 47040 bytes. There are 6 commands available on the ZX EPROM, LOAD, SAVE, DIRECTOR, FORMAT, EXIT, and DELETE. Other commands which are actually basic programs, are provided or the

supplied disk. There are things such as a "bedbook scanner", and a 2 drive copy program, for copying drive 1 to drive 2.

The documentation provided is short, sweet, and as complete as you could want. If you have any problems with anything, you can call Larry Kenny (Larken Electronics)...he is extremely friendly, and glad to help.

In my opinion, the LARKEN DISK DRIVE INTERFACE has got to be the most useful extension that I have made to my ZX81. The money it cost, is nothing compared to the joy of getting rid of the frustration of knocking over stacks of tapes on your desk, or losing that program you just spent the last 3 hours typing in (and didn't backup, because of the "5 minute save").

The Larken Disk Drive Interface is available from Larken Electronics, RM2, Huron, Ontario, Canada R4B 1G9. Phone: 613/825-2680. Price is \$99.00 (U.S.). Add \$5 for 2-drive version (upgrade is available for \$10, if you change your mind later).

## ZX-CALC + R.F.R.G.

Reviewed by D. Hutchinson

ZX-CALC + R.F.R.G., is a complex and comprehensive spreadsheet/accounting package. It is in this reviewer's opinion, that the programmer has made an "all-out" and honest attempt to surpass the features and flexibilities of another spreadsheet, WU-CALC from Timex. WU-CALC has been around for sometime, and it is lacking in a number of spreadsheet functions that the professional packages offer. ZX-CALC comes as close as possible to a professional package.

The R.F.R.G. part is a supplement to ZX-CALC called an "accounting mode". (R.F.R.G. stands for Rodriguez Financial Report Generator). The author states that it is used primarily for sole proprietorships who do not have the company's assets tied up in hand. R.F.R.G. sets up several templates and "worksheets" for various calculations. I found this section very useful in analysis of a company's financial picture using information supplied by financial reporting.

It should be noted up front, to prospective buyers of this spreadsheet package, that it does soak up memory...a lot of memory. In fact a 64k Ram Pack is a must. Also, printing is done on the 2040 printer. Be prepared to have a lot of rolls of the "shiny" stuff around, because if you're going to really get into this program, your 2040 will be working overtime.

Perhaps the biggest drawback of ZX-CALC, is the printing feature. A spreadsheet consists of several columns and rows across a page (ZX-CALC has a maximum of 15 columns across). When hard-copy is done on the 2040, one would have to physically glue the strips all together to compare the full report. This is an inconvenience and would never do for a professional copy. My suggestion would be to add the facilities for the use of full-size printers. The Memotech and Aercio interfaces are the most popular for the ZX/TS computers, and print drivers for these would make this already great program, a fantastic one!

ZX-CALC has many sub-menus and features (probably more so than we have time to describe them all). There is a grid (or matrix) of 30 rows by 10 columns, with a total of 3300 characters per spreadsheet (file 430 "cells" total). The built in math functions of the ZX81 are available to perform the calculations. Editing and manipulation of the cursor and across the spreadsheet is very slick.

ZX-CALC is a very sophisticated spreadsheet, and at the \$16.95 price (plus \$2.00 for shipping and handling), it presents an excellent buy, and perhaps the most flexible spreadsheet I've seen for the ZX81/TS1000. There is also a version available for the T/5 D068.

You can get your very own copy from: A.F. Software, 1605 Pennsylvania Ave., No. 204, Miami Beach, FL 33139. 305/531-6464.

# "More About...The Mystery of the Missing 253"

by Wes Brzozowski

## THE GREETINGS

Welcome back to another episode, as we try to unravel a few more clues about the Extended Bank Switching for the Times Sinclair 2068. This time, we'll be getting heavily involved in how the bank switching hardware would have worked, making this installment the most complicated of the series. But this article will cover a lot of subjects, and if one item seems hazy, just skip it and move on to the next. With some rereading, things will get clearer, so don't get discouraged. And don't forget that the order that's easiest for YOU to learn these things, may be different from that of others. Keep rereading, and learn in your own way.

Since this kind of information hasn't been published elsewhere, I've had to invent my own notation for a lot of things. These were covered in Part 1, but if you've missed it, you can still get the back issue—July/August 1984 for \$3.00 from TIME DESIGNS MAGAZINE.

This paragraph is for those who may have written or called me with information/advice/questions. If it appears that I'm ignoring you in this column, I must beg you to remain patient. Most of this second installment will have been written before Part 1 has even been put into print (publication delays, you know). As such, there's a good chance you'll have "missed" being mentioned in this installment. But rest assured that I do appreciate your interest, and WILL get to you in Part 3.

Some of you who've been looking up my page references for the TS2068 Technical Manual have probably been a bit befuddled. If you bought your manual from Times, everything will be fine. However, the new version from IDN has the pages re-numbered a bit, and the page numbers I gave last time won't quite match up. I wasn't aware of this when I wrote Part 1, and will give the section numbers instead, from now on. I hope no one was inconvenienced by this. In order to accommodate everyone, let's define yet another notation. From here on, Technical Manual references will be abbreviated. The expression "TM3.3.2" would then refer to section 3.3.2 of the TS2068 Technical Manual.

By the way, I do hope no one is grumbling because of the renumbering trick. In doing this, our good friends at Time Designs have been able to reduce the total number of pages in the manual, and so perhaps they can avoid actually losing money on the venture.

And now, on to the good stuff!

## A (NOT SO) QUICK DESCRIPTION OF THE RAM RESIDENT CODE

Let's first turn to page 255 of the User's Manual that came with your TS2068. The memory layout shows two blocks called the Utility Function Dispatcher, and the Bank Switching Code. They originally come out of the EXROM, and are copied to RAM during the computer's power-on initialization. The two memory maps on page 254 refer to these as "RAM Resident Code", and show that they may reside in two possible memory locations. To make this easier, the EXROM contains a routine that can relocate the code for us, well, almost. The "relocator" fails up on a couple of routines when it moves them to high memory. We'll discuss how to fix these in a future installment. Nevertheless, a short look at how now will make other things easier for us to make this easier.

The function dispatcher is a prime example of the right paw in the wrong church. In most computers, CALLING ROM routines directly through their memory addresses is considered about as civilized as blowing one's nose on the tablecloth. This is because later ROM versions may change the locations of the sub-routines, rendering your programs unwritable. This was precisely what happened when Sinclair changed the ROM on the early Z801s. (If you remember this, you're a true "old timer".)

The "proper" way to get at ROM routines is to pass up your CALLS through an "Operating System" that can find the routines, so matter what ROM version is in place. This wouldn't give you access to all of the ROM, however, and so requires an extra measure of programming discipline.

Is it worth it? Only when handled properly and consistently. A very similar kind of discipline allows many programs

that run on a "plain vanilla" IBM PC to also run on the PC Jr. and the PC-AT, which are all radically different from one another, from their disk systems, right down to their ROMs. It also allows the programs to run on the "PC Clones", that have VERY different ROMs in them. While this programming discipline means a bit more work, it has great advantages.

The TS2068 Function Dispatcher is a scaled down attempt to mimic this portion of an operating system. As mentioned last time, it's likely that at least someone at Times hoped to re-write the ROMs. The Function Dispatcher may have been a way to insure software compatibility. By sending a "function number" to the dispatcher, the proper routine can be accessed. It also contains previously unused abilities to pass and receive data from the routines it controls. Those future ROMs may well have tapped this ability. Note that TM3.3.2 contains a reference to "the original TS2068" (as it describes OUR machines). Follow-on machines were certainly planned.

But we Times enthusiasts, ever the unruly lot, totally ignored the Function Dispatcher, happily CALLING anywhere we liked. While the Function Dispatcher might make it easier to get at the ROM if we were running in one of the (presently non-existent) expansion banks, it's otherwise fairly useless.

We would only use the Function Dispatcher to protect our programs against ROM address changes. But instead, no one uses it, and no one is protected. Therefore, no one will market a ROM with EXROM sub address changes, because precious little software will run on it. And therefore, we needn't worry about ROM changes, and can CALL the ROM to our heart's content. It was a noble thought, Times, but it was a bit like trying to domesticate a mongoose.

The block called the Function Dispatcher also contains some code that allows the maskable interrupt to work properly when the EXROM is switched in. It will also work with expansion banks, if they have a copy of the code at ROM00 at their own location 003B. (The initialization code was supposed to copy this code into RAM expansion banks—unfortunately, it misses a byte, and anyway errantly tries to copy from the RAM bank to the EXROM; a truly useless exercise.) The interrupt code makes considerable use of the rest of the RAM Resident Code to manage the necessary bank switching.

Following this, almost as an afterthought, is a copy of the MNC handler at home ROM location 006E. This inclusion is somewhat perplexing, as the home ROM already has it, the EXROM doesn't link to it, it's short enough to be easily included in any expansion bank, and it doesn't work, anyway. The widely publicized MNC bug, first seen in the Spectrum and perpetuated in the TS2068 home ROM has been faithfully copied here. There may be some subtle reason for the MNC handler to be there, but it's more likely that a Times programmer, feeling the pressure of overdue schedules, included it without actually understanding it. At best, it reserves space for some proper code to be put later, but to us it's fourteen orphan bytes of code that are NEVER used.

Following the Function Dispatcher is the Bank Switching Code, which will be quite useful in this series. This code is a bone-meat memory manager which, with a little bit of extra flesh (and a lot of debugging), would shield us from the "hard-ware realities" of bank switching. While it's fairly easy to write our own machine code to switch the standard banks, the expansion banks are another thing altogether. But by always using the Bank Switching Code, we should never have been able to tell the difference. The code contains pointers to do standard bank switching, portions to access the expansion hardware, and enough "smarts" to know when to do either. As such, bank switching is changed from an occasional alghave to a constant minor irritation.

Ironically, it would be better to describe the "useful

stuff" next time, when we'll be concentrating almost completely on the system software. But as a quick description, the code allows us to switch banks, move bytes between banks, find out which banks own which chunks, do the equivalent of CALL and JP functions to other banks, and other necessary niceties. Flowchart 2 (which we'll discuss next time), shows how the BANK ENABLE routine works. This does the actual bank switching for both standard and expansion banks, and after we've seen how the hardware would probably have worked, you can check the flowchart for an example of how the hardware and software mesh together.

As has been said, this code could have resided at two different locations. Normally, it starts at location 6200, but it can be relocated to PS00. There are several reasons for this.

If we want to add code into the RAM, there are two basic places to put it and not interfere with a BASIC program being entered. One is above RAMTOP. This is so easy to do that it's the location of choice for most T/S programmers. Yet, it's almost as easy to clear a convenient memory block down BELOW the BASIC program in memory. The RAM Resident Code can do either.

Now, the Spectrum has no RAM Resident Code, lots of programs for the Spectrum reside above RAMTOP, and the folks at Time made a reasonable effort to convert Spectrum programs for the TS2068. (Almost ALL programs I've referred were first sold for the Spectrum.) As such, the low memory spot is preferable, as it avoids memory conflicts. This is, in fact, where we usually find the code.

Unfortunately, the convenient low memory area is right in the middle of the space used by the second display file for the extended display modes. There are hardware reasons for this. Some of these allow both display files to reside in just two memory chips, which must be faster (and hence, more expensive) than the rest. Also, the exact location of the second display file should have allowed them to employ some little used properties of dynamic RAMs to squeeze some extra speed out of them, when residing then for display data. Therefore, when the second display file is being used, the code is moved to the less preferable (from the designer's viewpoint) location above RAMTOP.

By the way, when you're switching chunks in and out, it's always necessary to have at least one RAM chunk available, to hold the machine state. It's needed, among other things, to make CALL and RET work and some extra work to tell that we often forget about the stack altogether. The good folks at Times sought to help us out in this regard, by moving the stack along with the RAM Resident Code. Since this code must be available,

the stack always remains available with it, and we can happily forget about it, once more. The only disadvantage is that the stack size becomes limited (they allow us 512 bytes, or 256 entries). This is limitedly not a problem.

The ability to have the RAM Resident Code in two different locations has another advantage. Although the TS2068 only moves code to high memory when the second display file is active, you can move it (and your stack) there yourself, if you can choose to run it in either chunk 3 or 7, you don't have to tie up one of your precious eight chunks just to keep the RAM Resident Code available to you. Simply switch back and forth to whatever chunk your own code isn't using at the moment. (Of course, you'll have to keep track of where the RAM resident code is, in any given situation.) Also, you should retain control to the TS2068 ROM, so you'd do the RAM Resident Code back where the computer expects to find it.

## ONWARD, INTO THE PAST

Last time, we looked at how to read and write to the bank switching registers in the extended bank switching hardware. We then saw a quick summary of what the registers did, with a promise to explain them in detail, this time.

To recap, there are four input and four output registers, which correspond to four memory-mapped I/O locations. We call the registers CO, AO, BS, and AB, and they sometimes are linked to memory locations 4000, A000, B000, and 4000, respectively.

Each expansion bank has its own register set. When we write to certain registers, every bank will "pick up" the information. In other cases, when we write to a register, the information goes only to a selected bank.

To further complicate things, only writing to a "generic" register will actually cause data to be put in a conventional register. In other cases, it may only change certain bits in a register, or not go into any hardware register at all! The "Bank Switching Registers" form a motley crew of circuit functions that are as different from one another as the Marx Brothers, and are just as wild when we put them together.

Figure 1 is a block diagram of a "generic" bank switching SCLD. Note that in reality, a RAM bank SCLD would have included memory refresh and address multiplexing circuitry, for dynamic RAMs. A ROM bank SCLD would have a set of chip enable signals. But the figure does contain all of the Bank Switching Registers, and these should be common to both SCLD types. It can then be used to show how the bank switching scheme works. It also shows how the odd bank switching philosophy selected by Times would have allowed the SCLD chip to go into an inexpensive package with a very small number of pins.

Note that this is only a block diagram, not a complete circuit layout. Also note that it's based entirely on an analysis of what the ROM software is doing. If the designers at Times intended additional functions not supported in the original TS2068 ROMs, we'll know nothing about them. Lastly, please note that the connection to the RESET signal is probably not what the Times designers actually planned. It's included here to suggest that there has to be some way to "disarm" all the horizontal select registers when the computer is first turned on. Otherwise they'd start out filled with random bits, and random banks would all try to "take over" the same memory chunks at power-on, with some very lively results. Actually, an odd bit of code in the initialization software suggests that each bank is "unlocked" after the Horizontal Select register is disarmed through software. This suggests that the SCLD should also contain some power-on "lockup" circuitry to keep each bank out of mischief until the computer straightens it out. We'll see this more when we look at the software that actually uses it. (See Flowchart 3.)

As we said last time, register data is sent to the Expansion Bank SCLDs one nybble at a time, to cut down on the number of SCLD pins. This means that the SCLD has to alternately send the nybble into the SCLD and leave half the nybble "in" while reconstructing. We also said that sending 02 to reset the CO will reset the nybble steering logic. Just in case a noise pulse may have sent a "false nybble" out, messing up the steering of later nybbles.

But if this is all we do, it won't work. If the nybbles are not being read properly, then the 02 sent in to correct the problem won't get read either. This is why we said that the CO register must interpret the 02 command, and remove the nybble synchronization is faulty. It also has to be able to interpret it if it's sent as only a SINGLE NYBBLE (just the 2), since that's how the routines READ BS REG and WRITE BS REG send it.

A "proper" implementation requires all of this, though it's a job to implement. Things get much simpler if we "bend the rules", just this once. Our little trick centers around the fact that a command to the CO register has to be sent. The most significant nybble, only the "02" command has data line D0 set,

## ST CLASS MAGAZINE

At last a computer magazine on cassette for the TS2068. No longer will you have to type in long fastidious programs. Just load and run!

BYTE POWER is the ultimate magazine for the TS2068. Each cassette is full of programs, a real TS2068 owner's dream.

BYTE POWER is a software based magazine with over 130 programs per year, most of them in machine language.

And all that for...

LESS THAN 39 cents A PROGRAM  
(Based on 1 year subscription)

Plus you get reviews on Software or Hardware for your TS2068 and tips on how to program better.

and this command is only sent by the READ BS REG and WRITE BS REG routines, which send it in the single nibble version, only.

And so, if we agree NEVER to send the 80 command to register 80 except in the single nibble version, the hardware will be much simpler. Any time we write to the 80 register with the 01 line set, the nibble steering logic is reset. The ROM code is completely agreeable to this trick, and so the good folks at Tandy may well have had the same idea. Figure 3 is drawn to reflect this simplification. Let's walk through it now.

The lower 4 data lines come in at the top, flowing to the Nibble-To-Byte Converter. Every time the select logic detects that we're writing to a Bank Switching Register, it sends the Nibble-TO-Byte signal, allowing the Nibble-To-Byte Converter to convert the nibble. Whenever the select logic detects that we're writing to register 80 with 01 set, it sends the 80-RISCT-NIBBLE signal, which resets the nibble steering logic.

The functions mentioned so far are common to every bank. This means that if you're building your own expansion bank, and are putting more than one bank on a single board, you can share this circuitry. (Just thought you'd like to know.)

The Nibble-To-Byte Converter also reconstructs the original byte we intended to send. Whenever the "second nibble" is written in, the select logic sends out another signal. If the nibble is written to register 80, then the signal WR-80 is produced. When it goes to register 80, then the signal WR-80 is sent. Similar things happen for WR-40 and WR-40. Note that these signals must be tied to 0 as not to occur until AFTER the Nibble-To-Byte converter has a byte ready to present.

Using this scheme, when we write to register 80, our value ends up in the Bank Number Access block. This block may also be shared. This works because each bank has its own number. If we wish to change the Horizontal Select byte for a certain bank, we first write the bank number to register 80 (Bank Number Access). Then the Horizontal Select register for that bank (Horizontal Select). Only the Horizontal Select register for the bank we have "accessed" will be changed. The bits are high active, that is, if a bit contains a "1", then its corresponding chunk is allocated to that bank.

Registers that cannot be shared have that property because they contain information that's unique to their own bank. As such, we'll refer to them as Unique Bank Registers. Those that can be shared will be called General Bank Registers. (Bank Number Access is General; Horizontal Select is Unique.)

A bank knows it's being accessed when the number in its Bank Number Access register matches another block called the Assigned Bank #. When they're equal, the 8-Bit Comparator sends the ACCESS-THIS-BANK-1 signal, which makes it possible to write to the Horizontal Select register, or to read from any of the four read-registers in this bank. The Assigned Bank # register is set from a write to register 80, but only under a very special situation that we'll call the "setup mode." We'll discuss this in the section on the Daisy Chain. Ordinarily, writing to register 80 does something very different.

When the system is in what we'll call the "normal mode", a write to register 80 sends the "Universal Deselect Byte" to all expansion banks. This looks a bit like a Horizontal Select byte, and has important differences. Each bit represents a memory bank, just like a Horizontal Select byte, but if a particular bit contains a zero, each Horizontal Select register will leave its corresponding bit alone. If a particular deselect bit contains a one, then if ANY Horizontal Select byte has a one in that location, it RESETS it. As such, the Universal Deselect byte tells all banks which memory bank to deselect.

So, if we want to give chunk 5 to expansion bank 807, we first make sure that the Bank and EXROM banks don't have it. (The BANK ENABLE routine would first give this chunk to the Home Bank.) Then we send the hex value 20 (bit 5 set) to register 80. (If any expansion bank had chunk 5, it will have relinquished it. Bank, we send 07 (the bank number) to register 80 (Bank Number Access) and finally we send 20 (bit 5 set) to register 40 (Horizontal Select). We have now given chunk 5 to bank 07.

Unfortunately, in the above example, we've also wiped out whatever value was originally in the Horizontal Select register. Actually, when the BANK ENABLE routine acts this crudely for all but the Home Bank. If we wanted to treat at least the Expansion Banks with a bit more dignity, we could have first read the Horizontal Select register by sending 07 (the bank number) to register 80 (Bank Number Access) and then reading the register pair 80 and 40. (Remember, the READ BS REG routine reads PAIRS of registers.) We would then have the Horizontal Select byte as it had already been changed by that bank. We could then have only changed bit 5, and any other chunk that was already selected for this bank, would remain selected.

It's also possible to read the register pair 80 and 40, for the bank number presently being accessed. While the ROM software reads this pair, it only looks at bit 2 of the resulting byte. This happens to be bit 2 of register 40, and every bank has this bit grounded. If we look at the TS2066 schematic, we see that

## Great New Graphics Design Program for the 2066 by

### Lemke Software Development

Pixel Sketch and Graphics Editor 2066 version 2.0 is an update of the original PS-G2 2066 with the added powerful graphics editor capabilities: WINDOW COPY, ERASE, ROTATE, ZOOM, HIDE VIEW, PAINT SHADRETT, BRIGHTEN, SHADE, IN, WHITEN and DISCART. MERGE pairs of two images into one screen. Full set of 64 KTS 2066 is included.

Pixel Sketch and Graphics Editor 2066 uses the ADVANCED VIDEO MODES for EXTENDED COLOR and 8K RESOLUTION (32 x 176 GRAPHICS, PS-ICE 2066 version 3.0 & 4.0) with enhanced, MINIDISK, EASY to use and FLIN, FREE, RAND, DRAW and DRAW 2 same "factor" image. "COPIES" feature copy no error! Copies 20 page screen change. NEW FUNCTIONS: CONNECT-W, connect drawing points, CHANGE FONT, automatic STANDARD, BOLD, MODERN, and ITALIC fonts available. A set character set can be modified to look like MODERN or ITALIC versions of that character set. LOAD FONT shows the same as LOAD the copy of Pixel Sketch and Graphics Editor 2066 version 2.0 from LEMKE SOFTWARE DEVELOPMENT today! Only \$10.00 per copy (includes the original PS-ICE and original tape of pixel sketch and graphics editor 2066). Send logo, a \$4.95 for color screen and a complete listing of top quality programs. TANDY. New with your order you get TANDY a 32 column screen to 64 column in resolution and a screen conversion utility program. Can even convert 2 standard screens to make 1 in resolution mode!

02 line (and ONLY the 02 line) has a 30K pullup resistor. As such, if we put a bank number in register 80 and then try to read that bank's 80 and 40 register pair, the resulting value will have bit 2=0 if the bank exists, and bit 2=1, if not. This function is used during system initialization to find out how many banks are actually plugged into the system.

If all of this looks like a programming nightmare, that's because it is. Don't forget though, that the initialization software and the RAM Resident code will normally handle it all for us. The only people who really need to know how to directly program the expansion banks are those who plan to build their own, and have to know how to debug them.

Since the bank switching 80 only uses address lines A13-A15, there can only be a limited number of possible Bank Switching Registers. These are 80, C0, 40, 80, 60, 40, 80, and 00. Since only the top 3 bits are actually used, 80 would be the same as F0, or E7, for example. Each of these corresponds to a single memory chunk.

But the possibilities are even more limited than this. What we've said implies that reading a register happens when we read a memory location from its corresponding chunk, and the memory mapped I/O is enabled, but running machine code is that chunk also causes memory to be read. As such, code that can activate the memory-mapped I/O cannot run in a chunk that corresponds to any register. The only routines that ever access them are WRITE B1 REG and READ BS REG, which we walked through last time. These routines are not in the Bank Number Access and are located in other chunks 3 or 7, so the corresponding registers 80 and 60 must not be implemented in hardware. (Nor should the Bank Switching Code be relocated outside of chunks 3 or 7!!!)

Also, it's possible that an interrupt could occur during the short time that these routines enable the memory-mapped I/O. This would cause the keyboard routine in chunk 5 to be in a before returning to the keyboard routine in chunk 5. This leaves register 20, which is not used and has no apparent problem with being used. All of this is mentioned because, if you've implemented the necessary registers, it should be fairly easy to try to add more for your own use. This explanation (hopefully) shows that only register 20 is worthy of any consideration whatsoever. But note that register 20 is comparable to memory locations 2000-3FFF. If we totally forget about using 20 at a new register, it would be possible for a ROM

A FORMAT FOR THE FUTURE

bank with just a 16K EPROM to contain a completely new and up-graded version of the Bank Switching Code in those locations. (The stack would have to go elsewhere.)

At the bottom of the diagram, we see a block called **Chunk Select Logic**. This compares Dits A13-15, which define which chunk is being accessed, and the Horizontal Select byte, which defines which chunks the bank "owns". The use of 10A5 tells it whether we're really accessing memory or just a bank switching register. If the T32068 is accessing one of this bank's chunks, then the LNBALL signal is sent out.

Note that as logic doesn't check `ENABLE`, if the T52066 isn't accessing memory, then the `ENABLE` signal may switch back and forth, but it will do so harmlessly, since the memory select logic further downstream will sort it out. However, the address lines settle out a full clock cycle before the `ENABLE` line does, and so this buys us extra switching speed. This is needed because `ENABLE` is used directly to generate the `BE` signal, and many `RAMS` to be applied fairly early on, but again is harmless if memory isn't being accessed. We also used the `BE` line in our own projects learned this the hard way as just seemed polite to pass it on to save anyone else the trouble.

AJ3-35 match the appropriate bit in the Horizontal Select Register. It also could optionally be sent out if IOAS is low. AJ3-35 match the Horizontal Select, and the chunk in question is 3 or 7. [This would let the READ BS REG and WRITE BS REG routines run in an Expansion Bank WITHOUT getting cut off in mid-instruction when they switch IOAS. No, I don't know why you'd want to do this, but you may have some good ideas that I don't.

Figure 2 shows an entire expansion bank, including the SLD we've just discussed. The BE signal is generated from the ENABLE line as an OPEN COLLECTOR signal, so that many banks can share the output. An alternate method in use in some products today to simulate a Spectrum Bus generates BE with a logic inversion and a blocking diode. This is also quite acceptable.

The Memory Decoding Logic will then decode the bank's memory as normal, except for one, or possibly two, additional constraints. For the first, memory is only enabled if **ENABLE** is active. The second possible constraint is based on educated speculation, but is still admittedly a bit of guesswork.

We know that the TS2068 is basically an enhanced Spectrum. Whenever possible, Sinclair's design was used, and Timex did announce that it would release its own version of the Sinclair Microdrives. This device uses its own crude version of basic

THEY suggest one way (but certainly not the only way) to understand the Bush-Eisenhower transition.

switching, wherein it disables the Spectrum ROM and switches in its own when the code in the Error Handler (location 090B) is run.

The extended TSD008 commands, like LOAD =, SAVE =, and FORMAT, MNR, and CAT are implemented for the ROM almost exactly like they're implemented in the Spectrum. That is, if you know the command format, you can type them into a line of BASIC, and the TSD008 will accept them. However, they're set so that when you try to RUN them, the error handler in location 000B will be executed. The only way to make the commands work is to switch in another ROM where the instruction is run at 000B. It must then check the cause of the "error", and run as extended command, if one is pending.

There are two ways to do this with Extended Bank Switching. We could define another special bank number (perhaps FE) which switches into chunk 0 when the instruction at location 0006 is executed. But every other expansion bank would have to contain the circuitry to check this, and switch themselves in and out, adding cost and complexity. Alternately, we could put the circuitry for switching circuitry only inside the microdrive interface, and give it the ability to disable all banks when it switches to its un-numbered "Superbank".

As the superbus 1600 sends a signal that does so, the expansion benches what **is** due to the Standard Bench. The T32068 has 3 backplane signals that are **used** but not **used** in the computer. These are **BZIN**, **OROUT**, and **BUSISSO**. We'll see in a minute that **BZIN** and **OROUT** are needed elsewhere, so let's speculate that **BUSISSO** would have disabled the Expansion Bench. (I've heard mention that **BUSISSO** was instead intended to tri-state **J15** in the T32068, but the schematic says it isn't wired to that chip. For the moment, let's consider this is an unreliable rumor, but I'd welcome any evidence to the contrary.)

Now, taking back to our merry decoding discussion, we may then guess that the memory address 0x00000000 at the 30E15050 line. The diagram shows a "Special Buffer" at the 30E15050 line, because the lack of a "bar" over its name suggests that it's high-tristate. This means that the buffer must "see" a low signal if no microdrive interface were plugged in, leaving it floating. This is opposite to what a TTL buffer would do, although some DTL structures would fit the bill nicely. Note that if the microdrive interface were part of the SEU, then 30E15050 would never be floating and the special buffer would be unnecessary.

"WHAT DO WE DO NOW, BATMAN?"

Now, all of this may be very nice, but there's still one glaring problem. When we want to send information to a Unique Bank Register, we must first put its number in the Bank Number Access register. If this matches a bank's Assigned Bank #, we can then access that bank's Unique Registers. But the Assigned Bank # is itself unique, so how do we get a value in there, if

## SPRITES 2068

**FANTASTIC NEW PROGRAM!** Exciting & Educational

You've heard of SPRITES. Explore the subject. Create Moving Displays and Games. Buy a copy for your TS-2068, they belong together.

**FEATURES:**

- SPRITE SERVICE UTILITY (2520 Bytes IMPROVED professionally written machine code)
- SPRITEDRAW Program (Great NEW program makes drawing a SPRITE both fun and easy)
- Operate from BASIC (Utilizes a Machine Code interface, Twelve SPRITE Commands)
- Operate from Machine Language (VERY QUICK Screen Action! Bonus NCSPRITES program)
- Cassette Tape (Includes demonstrations and instructions, Menu driven, Fun to watch)
- Manual (34 pages written in "user friendly" style for all programmers)

the first place? When we first turn the machine on, that register will be full of garbage. How do we find out what it is? Morse yet, what if TWO banks "power up" with the same Assigned Bank #?

It would seem we've painted ourselves into a corner.

#### DAISY, DAISY, GIVE ME YOUR ANSWER DO

To our rescue comes an incredibly oddball kludge called the Daisychain. The main purpose of this wheeze is to let us put a value into the Assigned Bank # register for each bank. Since we can't use the Assigned Bank # register to access the bank at this time, each bank contains a flip flop that's one bit of a shift register (the Daisychain). Ordinarily, each bank's flip flop contains a "0", but a single "1" bit is stepped through, from bank to bank. If a bank has the "1", then we can put a value into its Assigned Bank # register.

Figure 3 shows the BEU functions that are needed to add Expansion Bank capability. It will drop the BE line if BUSISO is active, or if IOAS is low and A13-15 indicate that the chunk being used is not 0, 3 or 7. This will prevent the memory in the standard banks from trying to "answer" an attempt to read a Bank Selection Register. The rest of Figure 3 is the start of the Daisychain.

The BEU contains its own form of the CO register. It normally operates in what we'll unimaginatively call the Normal Mode. Everything we've described so far assumes this mode. However, if we send CO to register C0, we reset all the bits in the Daisychains and enter what we'll call the Setup Mode. This switches flip flops in the BEU and all the expansion banks. Also, DOUT at the BEU goes high.

But DOUT at each expansion bank is still low! Figure 4 shows how this can be. Unlike all other backplane signals, which are shared on a common bus, DOUT and DOUT are not. This is necessary in order to retain the structure of a shift register. Unfortunately, this is not really compatible with the normally used method of stacking additional items onto the backplane, which would short all the DOUTs together and DOUTs together, and wouldn't match one DOUT with the next DOUT. In fact, it would seem that the most convenient method would use expansion banks as edge-connected cards, plugged into a motherboard, filled with female edge connectors.

By sending an 01 to register C0, we clock each flip flop in the Daisychain, and the "1" bit moves into the next bank. When we're in the setup mode (and ONLY then) we can write the Assigned Bank # to register A0, and it will be put in the Assigned Bank # register of the bank that has the "1" in its flip flop. In this way, we individually access each Assigned Bank # register. When we're done assigning numbers, we send 04 to the CO register, which clears all flip flops and puts us back into the normal mode.

#### AN INTRODUCTION TO THE SYSCON TABLE

If you haven't yet done so, read TH3.3.2, which gives a snail's eye view of the subject. The "proposed expansion banks" are the very same banks we've been talking about. The SYSCON table is a list and description of all the extra "memory" plugged into the TS2068. The LRU25 and AR05 parts describe what you've got plugged into the Back Bank, and comprise 12 bytes. Note that each expansion bank takes up twice as many bytes, suggesting that the good folks at Times planned to put a lot more "horsepower" into those guys.

One thing may appear just a bit distressing. The table description says there's room for only ELEVEN expansion bank entries. Well, it's even worse than this, because the space for eleventh entry is used as a scratchpad by the initialization software. (Possibly a bug.) But if we really want more, we should note that the system variable SYSCON contains the address of this table, and we can change this, and put a larger table of anywhere we'd like. Each expansion bank has a chance to run some of its own code during initialization, and one of these can re-write the table. But the hardware that contains this bank should also contain some fancy buffering circuitry for the additional banks, or there'll be TTL fanout problems, not to mention unacceptable capacitance on the bus lines. (Actually, if you try to figure out just how many TTL chips will be needed to replace one bank switching SCLB, you may find it unlikely that even ten expansion banks will ever be run together at the same time.) The table contains numerous options, and is laid out as follows.

#### SYSCON Table Description

1. Entry for the Back Bank. 2. For AR05 followed by 4 for LRU25. See TH3.3.2.3

Expansion Bank descriptions follow. One 24 byte bank for each bank.

1. 0-1000 Bank 2. 0-1000 Bank 3. 0-1000 Bank 4. 0-1000 Bank 5. 0-1000 Bank 6. 0-1000 Bank 7. 0-1000 Bank 8. 0-1000 Bank 9. 0-1000 Bank 10. 0-1000 Bank 11. 0-1000 Bank 12. 0-1000 Bank 13. 0-1000 Bank The portions marked as not used may have been reserved for future expansion, but at least one byte was probably set aside to identify the actual function of each ROM bank. This would allow us to find, at a glance, what additional functions were actually "squirreled away" in the extra banks.

The left hand column contains the SYSICON entry numbers, for example, SYSICON 03 contains the bank 3, and every bank has its own SYSICON 03. As such, the SYSICON entry number is not a displacement into the SYSICON table, but the displacement into the entry for a particular expansion bank. Only some of the table entries are self explanatory. Each will be discussed as we wade through its use in the ROM code.

#### A LOOP (FINALLY) AT SOME ACTUAL CODE

From here to the end of the series, you'll have the chance to double-check everything I've told you so far. All of my pictures, tables, and descriptions will have to be consistent with the Hexcode. It's fully possible that I've missed something in my search through the ROMs, and I'll be counting on you to let me know if you see anything that looks "suspicious". Together, we can add whatever finishing touches are needed for a full description of the Extended Bank Switching.

Don't forget we promised last time that the software is fairly civilized, though somewhat smug. If reading the hardware description has been as draining for you as setting it has been for me, we can take heart in the fact that it's all downhill, from here on!

Flowchart 1, given last time, is part of the very top level initialization code the machine runs when we turn it on. Part of the Home Bank RAM has already been initialized, and some system variables reflect this, but the memory map on page 255 of your T2000 652R's Manual shows "Machine Code Variables". The size of this is determined by the contents of the Dock Bank. (See TMS-1.2, TMS-1.2.2 for more information) and the system hasn't yet found out how much memory to set aside. Therefore, this, and the memory following it have not yet been set up. At this point, we check for extra memory plugged into the system:

At X00E7 we set the initial location of the SYSICON Table. This has space for AR05, LR05, 10 Expansion Banks, and an 11th Expansion Bank area, which (possibly due to a bug) is used as a scratchpad. Its size is fixed, and if we want a larger table, we must move it somewhere else ourselves. We then CALL X00F4 which actually builds the table (we'll flowchart this next time).

We then check the SYSICON table for an LR05. If there is one, there are no machine code variables, so we finish setting up the system variables, and run the LR05 according to its instructions (see TMS-1 for more information).

If there is no LR05, we end up at X00F4, checking for an AR05. If we find one, we check its type (see TMS-1.2.1). A BASIC AR05 uses no Machine Code Variables, so we finish setting up system variables, and return to Home ROM, after setting a flag telling it to run a BASIC program out of the Dock Bank. A m.c. AR05 uses Machine Code Variables, which we insert and then finish initializing the system variables. We then run the AR05 as required.

If there is neither AR05 nor LR05 present, we end up at X0013, where we can initialize the system variables. At X003A, we set up so that the main execution loop in Home ROM will run after initializing (an Expansion Bank can override this, if set up properly). We then point to SYSICON 00 for the first expansion bank, and enter the loop to check bank.

In this loop, starting at X004C, we check SYSICON 00. A value of 00 marks the end of the table, causing us to end the loop. If it's not 00, then we check if SYSICON 00 has the value 00. This marks the bank as inactive, causing us to point to the next bank in the SYSICON table, and loop to X004C.

If the bank is active, we get its number from SYSICON 01. Then from SYSICON 02, we get the initialization flag. If this flag is 01, then we will have already run some code that bank when the SYSICON table was built (more on this next time) and this bank may also "take over" the system after we're done initializing. This depends on its "Boot Up Priority", which we will discuss in a moment. If the flag is not 01, then we point to the next bank in the SYSICON table, and loop again to X004C.

However, assuming that the initialization flag was 01, we end up at X0060, which sets SYSICON 16, the "Boot Up Priority". (The lower the value, the higher the priority.) If this is the highest priority found so far, then we save it and continue. Otherwise we loop back to X004C.

If it is a higher priority, we get SYSICON 10. (Note that in my flowchart I accidentally reversed the digits and called this entry 01, SORRY ABOUT THAT!!) If the code were written properly the contents of SYSICON 10 would be the boot up priority we would run after initializing.) Unfortunately, due to a bug in the ROM, the address of SYSICON 10 is used instead. (This is a very nasty bug, but at least I can blame THIS error on someone else.) The new boot up address is saved, and we loop again to X004C.

FIG. 3. BEU FUNCTIONAL TO ADD BANKS AND BOOT

FIG. 4. T2000 WITH EXPANDED BUS AND DASH CHAIN

When we find a value of 00 at SYSICON 00, then we've reached the end of the table. We leave the loop, find the highest priority bank and boot up to the given address. (Default is Home Bank, at 00E7: the Main Execution loop.)

\*\*\* AEROG PD-55 Software \*\*\*  
Disk File Manager: Lists detailed directory and occupied tracks. Checks disk. Copies single or all programs on disk. All functions support 1 to 4 drive systems. Optional printer output. Available on 5.25" double density disk or on tape. DPM-disk or DPM-tape .....\$16.00

GenDisk: Conversion program for GenCalc (version 40000). Customizes all colors and keyboard buzz. Supports both tape and disk save/load. On 5.25" double density disk or on tape. GenDisk-disk or GenDisk-tape .....\$9.00

MSDisk: Conversion program for MSBasic. Customizes various default values. Supports both tape and disk save/load. Does NOT take away any text space. On 5.25" 80 disk or on tape. MSdisk-disk or MSdisk-tape .....\$6.00

\*\*\* Programs from JRC Software \*\*\*  
Diamond Mine II: A true arcade quality game with excellent graphics, speed, color, and sound. Collect enough diamonds and find the exit before time runs out. 32 different screens and 6 levels. Available on 5.25" 80 Aeroac disk or on tape. Diamond-disk or Diamond-tape .....\$17.00

Compuser: The COMPILER converts BASIC to 100 times faster machine code. It supports over 30 integer BASIC commands. The ASSEMBLER supports labels, multiple statements per line, and user comments. 5.25" double density Aeroac disk or tape. Compuser-disk or Compuser-tape .....\$18.00

Great Game and Graphics Show: This program package includes: GenGoscope, 3D City, Tough Text Tutor, Lunar Lander Game, 3D Graph, Color Page 2, and Editor, and MANY MORE! Available on 5.25" double density Aeroac disk or on tape. GGGS-disk or GGGS-tape .....\$17.00

QL  
KILL

QL KILL (not recommended for weak stomachs) is a simulation of the ever so popular (?) RUSSIAN ROULETTE game. The listing was converted from a PASCAL program and contributed by David Johnson, with permission from the author, Ron S. Morr. David would like to get in touch with other QL users. Write to: 2389 St. St. 95, Edison, NJ 07030.

# Quick Look

## QL Peintre

A Review  
by  
Paul Bingham

French language suffers the fate of English at times; being difficult to pronounce properly when read from text. So it is with QL "Pine tree", "Pain tree", "Pee-in-tray", or "Pay entry" as this program may have been so falsely introduced to you. If we could all read French it would be instantly obvious that QL "Painter" is a French screen artist program.

QL PEINTRE is a classy program in many ways. After loading begins a picture of two chips appears: seemingly a digitized photo image. Nearly three more minutes of on-and-off file loading finally brings a blank sub-screen with sharp surrounding icons. French and English titles toggle back and forth with a key press. The look is sophisticated, elegant. The icons are easily readable and easily used.

Should one require additional help, the documentation is excellent. Now this is not a flashy instruction booklet, but it is the first one I have seen which states simply what to press next and then accurately tells what the outcome will be. Even though the instructions do not mention it, I have found it helpful to have a formatted cartridge on hand for saving a screen prior to running QL Peintre. There is a Microdrive icon, but like so many other QL software titles, it does not provide for formatting of a cartridge. It does provide a nice scrolling directory option, though!

Like GRAPHQL, reviewed by Vince Lyon in the March/April '86 issue, QL Peintre has many, many abilities. Some are far more versatile as well. Circle and Arc drawing are so much improved! Fabulous, too, are the two type faces (one very Macintosh) in two sizes with four spacings each. Line and spray widths with intensities are very adjustable as are the colors and textures. But keep in mind that QL Peintre is capable of only four colors in High Res mode F1, and will not run in mode F2 on an American TV. QL Peintre supports all the colors in F2 mode.

Is Peintre perfect? It does have a limitation or two. It incorporates the standard security checks requiring a backup and original present. The screen work area is much smaller than other such programs. It only provides 63% of the screen that GraphiQL uses. It also does not have a wrap-around feature when drawing. If one bumps into the work space edge diagonally, the cursor continues straight along that edge until stopped. Jotting and spraying do not quite reach the edge of this work area either. These are really minor items, however. Unlike GraphiQL, Peintre never does "grow" back!

QL Peintre isn't intended as a drafting design or CAD program. QL WORLD MAGAZINE (from England), carried a review in the May '86 issue, of six such programs. Most CAD packages were more expensive than Peintre, too. Missing from their review was a new release, TECHNIQL (from Talent...writers of GraphiQL). Such would be good future Quick Look fare.

QL Peintre has a good set of save and printer options. The PrintJump program is unprotected and may be included by the user in other programs. I was amazed to find that it will load almost any saved screen, including ones from COSMOS (reviewed last issue) and GraphiQL, too. Screens can then be altered and printed out on an Epson printer. But the output process takes 22 minutes! GraphiQL's beats it by three or four minutes. But unlike other dumps, this produces an output sideways! So if your printer is like my little Epson Home-writer 30, most graphics look slightly elongated. Now with Peintre they just come out taller.

QL Peintre is sharp and professional. It has limitations but is very polished and easy to adapt to. If the programmers in France keep this up, I may start learning to read French.

### 2068 TO QL

WE ARE BUILDING BRIDGES BETWEEN TS2068 AND QL. WHETHER THIS IS UPLOADING OR DOWNLOADING QL, IMPORTING OR CONVERTING BASIC FROM TS2068 IS IMPATIAL. THIS IS NOT SOFTWARE. THIS IS A SERVICE. WE CAN TRANSPORT THE BASIC FROM TS2068 OR SPECTRUM TO QL. NO BOUND ON MC.

3. DATA IN ONE OR TWO DIMENSIONAL STRING ARRAYS.
4. DATABASES LIKE PRO/FILE 2068 OR MASTERFILE.

IF YOU WOULD RATHER SKIP THE MERGING PROCESS THEN ADD \$1.00 FOR EACH ADDITIONAL PROGRAM AND ARRAY. EACH ADDITIONAL 'LOAD' WITH THE SAME ORDER....\$11.95.

YOU WILL GET TWO FILES OF YOUR BASIC PROGRAMS: THE TRANSLATED VERSION, WITH THE SAME LINE NUMBERS, AND THE FACSIMILE FOR REFERENCE--BYTE FOR BYTE.

IF YOU ARE ONLY THINKING QL AND WONDERING HOW YOUR SPECIAL BASIC WOULD LOOK IN SUPERBASIC THEN SEND US A CASSETTE WITH ABOUT 30 LINES OF IT, \$4.95 AND \$1.00 FOR THE PRINT-OUT. ENCLOSE A CARTRIDGE AND ADDITIONAL \$3.00 TO GET BOTH THE PRINT-OUT AND THE SAVED LINES.

EVERY BYTE OF YOUR PROGRAM OR DATA WILL BE TRANSFERRED. LESS THEN 2% NEED BE EDITED. DATA NEEDS NO EDITING. EUGENE PERCIVA, 358 RAILROAD AVENUE BRIDGEPORT, CT 06604 (203) 574-8726

## RMG ENTERPRISES

IS PROUD TO ANNOUNCE

A NEW BUSINESS SOFTWARE PACKAGE FOR THE QLI

### INVENTORY/INVOICING PACKAGE

FROM EXECUTIVE WORKSHOP

If you are running a small business that depends on a GOOD  
Inventory control program, THIS IS THE ONE FOR YOU!  
With our new package you can keep track of all SALE, INCOMING STOCK,  
CURRENT STOCK VALUES - BOTH WHOLESALE & RETAIL,  
as well as generate the following hard copies:

INVOICES - BACKORDER MEMOS - PACKING LISTS - SHIPPING LABELS - INVENTORY REPORTS  
PURCHASE ORDERS - FLAGGED ITEM REPORTS - PRICELISTS - SELECTIVE PRICE LISTS

All of this and the best part is, WE WILL CUSTOMIZE THIS PROGRAM TO SUIT YOU!  
When you order this package, you will be sent a short questionnaire to fill out  
and return. Within 2 weeks you will receive your program, ready to go!

**ALL THAT AND AT A PRICE OF ONLY \$59.95 + 2ph**

FOR MORE INFORMATION ON THIS AND OTHER FINE QLI PRODUCTS  
CONTACT:

## RMG ENTERPRISES

# The Future of the QL in America And Some QL Graphics Systems

by

Mike de Sosa

## THE QL IN AMERICA

Many of us in recent years have, in anguish, witnessed the demise of first the Timex Computer Corp., then Sinclair Research USA, and finally Sinclair Research Ltd., itself. I say "in anguish" because with their failure went fond hopes of continuing professional support for our computers and dreams of a proliferation of third-party hardware and software. These organizations, blessed with an excellent product and the good will of many thousands of cult followers, just plain "blew it" and, in the event, passed up the opportunity for millions in profits. None seemed to learn from its predecessors. In each case, arrogance and poor customer relations prevailed. Statements like "we don't really need the U.S. market" and "each Sinclair employee produces millions in earnings" added to the insult of telephone calls that were not returned and letters unanswered. Many recommendations from periodicals, users' groups, and loyal customers, some based on time-consuming research, were spurned. If it was not the company's idea, it was not, needless to say, a good idea. The outcome, the result of arrogance and delays due to poor management, was probably inevitable.

QL users and would-be users in the U.S. are now dependent on a single distributor offering a limited number of QLs through a dozen dealers—without factory or engineering back-up. Before taking the plunge, would-be QL buyers should be aware of a few things and then satisfy themselves that their QL will be adequately supported. Item—the QL will be replaced in a year or so (perhaps this fall in the UK) by one or more follow-on "QL-compatible" systems that do not use Microdrives. Item—when the present small stock of QLs are gone, no more may be manufactured; this will affect the availability of replacement parts and maintenance and the quantity and cost of future software for the QL. Item—there is a difference in QDOS addressing that causes many software programs to work improperly on U.S. machines: for example, QL Project Planner, QL Decision Maker, GraphicQL, and VROOM! (This problem also affects U.S. software designers trying to get their programs to work on European QLs.) Item—the Psion software programs sold with QLs in the United States are now several versions old and the documentation for these programs is older yet. Item—the QL is poorly documented in the QL User Guide, and scores of books on the QL—all written early on before the operating system was perfected and before peripherals were available—do little to help the situation. (This problem—a major shortcoming of the QL since its launch, and before it the T/S 2068—was ignored by Timex and Sinclair organizations despite urgent pleas and recommendations by QL users.) Item—many QL users are now getting bad advice...better methods of communicating authoritative information regarding the QL are needed.

I do not believe that the QL distributors and dealers are moving nearly fast enough to correct these

problems, all of which are capable of easy and inexpensive solution. For this reason, prospective QL and QL software buyers should pressure the distributors and retailers to do something about all of these problems ASAP. In doing so, you would do yourself and them a favor, possibly saving them from a rather predictable self-destruction. Let's have some cards, letters, and calls on this, folks!

The following things should be done soon (and that doesn't mean "next year"):

a. Supply QLs with the latest version of Psion QL software. (It should cost very little to do this, and buyers would gladly pay an extra cost.)

b. Supply QLs with additional documentation to supplement the inadequate, frequently erroneous, and badly out-of-date QL User Guide. (Making this supplement available to QL owners here and abroad could make this a profitable endeavor.)

c. Devise a universal "patch" which would permit all European QL software to work properly on U.S. QLs. (This is long overdue—a result of inaction.)

d. Insure they are getting good technical advice regarding which QL peripherals and software to market in this country.

e. Decide whether the current U.S. version of the QL, Microdrives and all, should be manufactured further, perhaps with additional built-in or plug-in RAM and RAM-disk software. (An enhanced QL could be profitably marketed in this country for another two to three years.)

f. Make on-the-shelf QLs available with distributor installed disk interfaces, RAM cards, and RAMdisk software.

g. Select and standardize use of a disk interface with the QL and a single DS-DD drive, preferably a 5 1/4" drive.

h. Establish a toll-free "QL HOT LINE" for three or four hours a day to answer consumer questions.

i. Advertise the improved product. If nothing is done, that is, if things proceed at the present pace, my prognosis for the QL in the U.S. is a slow death.

## QL GRAPHICS/CAD SYSTEMS

There are now many types of graphics systems for the QL, ranging from those used to draw pretty pictures to two-dimensional computer-aided design (CAD) programs to three-dimensional graphics design programs. With one exception, I believe the best of these QL graphics programs are discussed below. [The exception, QL Peintre from France, is discussed by Paul Bingham in this "Issue of TON."] Also discussed this month, is a new and excellent font editor and print utility for the QL which I thought you should hear about. Finally, as an update to last issue's games article, a brief review of VROOM!, the grand prix motor racing game from France.

**Q Draw** by Psion: **Q Draw** is the software used by Psion to create the breathtaking graphics for **QL Chess** and **QL Matchpoint**. Very user-friendly, **Q Draw** can be used to create pictorial graphics of all types or to improve upon, or draw from, graphics screens produced by other programs such as **GraphiQL**, **TechniQL**, **Concept 3D**, **Easel**, or a screen created and saved from **SuperBASIC**. **Q Draw** offers four-color, high-resolution graphics as well as the more usual eight-color lower-resolution graphics. (High or lower resolution is not selectable from within the program.) Other features include a variable-width pen (or brush); the exploitation of created "shapes" which may be created or plucked from any screen stored on disk or Microdrive and then manipulated, copied, or stored for later use (a library of useful shapes is included and you may economically create your own library); two screen magnifications; and various cursor forms (a crosshair or screen grid may also be selected). There are no text or curvilinear functions which automatically create arcs, circles, or ellipses. Cursor position coordinates are not available, but this does not seem a great disadvantage in **Q Draw**. At \$25, **Q Draw** is the least expensive QL graphics program and in some respects it is the best of the lot—another winner from Psion.

**GraphiQL** & **TechniQL** by Talent: These two software programs from Scotland are so complex and comprehensive that a complete description of each is impossible in an article of this length. The best I can do is describe their capabilities and differences to help you decide which of these two superb programs, offering overlapping capabilities, should suit you best.

Talent's designers have had decades of experience in designing CAD/graphics software for mainframe and minicomputer systems. Their microcomputer versions for the QL, while reducing unnecessary complexity, at the same time incorporate several never before seen features.

A sample screen from GraphiQL.

**GraphiQL** is a graphics design program optimized for the computer artist or illustrator. **TechniQL** is a two-dimensional CAD (computer-aided design) package optimized for the technical draftsman. Although the two programs have few features in common, each can do a fair job at the other's tasks with a little extra effort, but **GraphiQL** pictures are limited to the size of a single computer screen, while **TechniQL** pictures occupy many screens and be drawn in many layers (analogous to acetate overlays on an engineering drawing). Both programs have good on-screen HELP facilities. Neither has a variable-width pen (brush).

**GraphiQL** is primarily a graphic arts program whose forty-six commands and other capabilities can be used for other purposes, including technical drafting. **GraphiQL** operates only in the eight-color, medium resolution (256 x 256 pixels) mode. Many methods of creating illustrations are possible, and cursor coordinates and other useful data may be displayed, if desired. Other features include texture and airbrush effects, screen magnification (16x), two text sizes, standard drawing shapes, and comprehensive screen/file handling. Available at \$50, including a 63-page manual, **GraphiQL** may be found in an improved Sinclair Research version, **QL Paint** with icon pull-down menus and a 123-page loose-leaf manual.

**TechniQL** is primarily a CAD and drafting aid, but with good graphic arts capabilities (except for text-printing which is better on **GraphiQL** and not available in **Q Draw**). Additional **TechniQL** features include the following: four-color, high-resolution and eight-color, lower-resolution graphics selectable from within the program; about forty commands which may be executed from five pull-down menus or by two letter key codes; rapid, multi-sheet printer output; multiple magnifications over a wide range; a RAM-efficient design storage system; the capability of creating and manipulating up to 75 elements (cells) as part of a single design; and comprehensive file storage handling. At \$70, **TechniQL** is the most expensive and comprehensive QL Graphics program.

**Concept 3D**, distributed by an American software company located in California, is an excellent two- and three-dimensional CAD program, although the distributors do not refer to it as such. Like **GraphiQL** and **TechniQL**, **Concept 3D** is too comprehensive and complex to describe in detail in an article of this length.

Apptly named, **Concept 3D** offers several new concepts in graphic design (those familiar with Psion's **Hi-3D** for the T/S 2068 will see some similarities). Operating in three modes, **Concept 3D**'s capabilities may be described as excellent but with significant limitations. For example, it cannot like **TechniQL** produce layered designs on multiple printed sheets almost automatically. **Concept 3D** produces only one screen dump at a time—and that using the screen dump program on the Psion **Easel** cartridge.

**Concept 3D** is, despite its complexity, relatively user-friendly. It includes the following features... several which are unique to the QL: about 50 single- or dual-keystroke commands listed on three main menus and other sub-menus; four color, high resolution and eight-color, lower resolution graphics selectable from within the program; three types of 3D modeling, two of which are automated; rotation of objects around three axes, seen from various perspectives; image magnification and reduction over a wide range; five text sizes; hidden line removal and surface modeling; excellent documentation in a 45-page user manual.

At \$40, **Concept 3D** is an ingenious and a well-executed program offering several features which are unique to the QL. My kind of program!

**Inkwell** by Palantir: An inexpensive font editor with print utilities for the QL, **Inkwell** at \$10 (£8 to

QUANTA members) offers excellent value for money. Eight alphanumeric or symbolic fonts are made instantly available by inserting simple codes in Quill documents. Variable line spacing, print emphasis, inverse printing, and equal or proportional character spacing may be specified for symbols/font characters prepared using a 16-16 font editor. A must for desk-top publishing with the QL.

**VRQOMI** by Pyramide: A grand prix motor-racing simulation by the distributors of 3D Meanderer. VRQOMI is potentially more interesting to play than QL Hyperdrive, its QL road-racing rival, but suffers from a fault or two.

**VRQOMI** includes five meandering racetracks of increasing complexity. Pass 10 cars and move on to the next circuit or begin all over again. Graphics and sound effects are fair to good. Your view is from the cockpit

of the race-car: the steering wheel and two front wheels are seen to move in unison. Joystick steering at speeds necessary to pass cars and advance to the next circuit is very tricky.

A victim of the QDOS address differences in U.S. QLs discussed above, VRQOMI does not accurately or completely depict the plan of the grand prix circuit in use. This may affect player steering: for example, while you are still shown to be on a straightaway, the track begins to curve. A second fault, perhaps related to the first, is that it is too difficult to pass another car at speed without either crashing or going off the road. At \$30, \$3 more than Hyperdrive, VRQOMI is preferable to the former despite its faults.

**NEXT ISSUE:** "Optimizing QL Quill". Future articles will deal with one main topic and, typically, discuss new or related software programs.

Note. All QL programs in the article were obtained from CLARRY COMPUTER, P.O. Box 8607, Glendale, AZ 85312, 602/978-2902; with the exception of Travel, which is available from PALANTIR PRODUCTS, Dept WFI, 40 St. Lukes Road, Redminster, Bristol BS3 4BX, England.

## Beginning Z80 Machine Code Part Four

by Syd Wynncoop

This time, right to business! We are studying the math instructions which are listed in chart 4. This is where it starts getting a little more difficult, but not so that you can't handle it. Up to this point, most of the lessons have been peripheral background needed to make sense out of the rest of the discussion.

We only have two math functions available to us: Addition and Subtraction. As with LD, this is not as limited as it first sounds. A study of Math Theory would teach you that all math functions are performed with addition. I'll not try to explain this further as it would fill a volume larger than all TDM's published to date. The point we need to understand and absorb is that multiplication is performed by repetitive additions. Likewise, division can be achieved by repetitive subtraction.

It is important that this makes sense to you. Think about the multiplication problem of 12x6. It can be solved by either of the following:

$$\begin{array}{r} 12 \\ 12 \\ 12 \\ 12 \\ 12 \\ 12 \\ \hline 72 \end{array}$$

Can you see how we can solve division problems by repetitive subtraction? If we had the problem 72/12, how many times can we subtract 12 from 72? Is there a remainder? Simple, isn't it?

This brings us to the first instruction...Add. We have already seen Add in operation. In Lesson 2, and probably have a good idea of its function. Trust me, it performs addition. Some of the later instructions will not be so obvious. We would read the instruction, Add A,E, as "add the value in the E register to the value in the A register and store the result in the A register".

In lesson 3, we learned that the A register is called the "Accumulator". The A register is the only register that can "accumulate" the results of eight bit

arithmetic. If we had wanted the result in the E register, we would need to assign it. Can you guess the needed instruction? You get an "A" if you said LD A,E. Otherwise, go back to lesson 3.

We also have available the instruction, Sub. The A register performs a special purpose here also. The A register is the only register we can subtract from. As with Add, the A register accumulates the result. You may see this instruction written as Sub A,C or Sub C. They mean the same thing. We will use Sub C as the A register is always implied in eight bit arithmetic.

I have mentioned several times that the A register will accumulate the results of eight bit arithmetic. We need to leave the instructions for some more background.

We have already learned that a single register may only contain a value in the range 0-255. There is a condition known as an "overflow" which occurs when these values are exceeded. The simplest way to describe overflow is by example. Let's assume we are adding 255+1. We have not discussed number systems yet (that's a later lesson) but let's show our example in binary as it will demonstrate the point dramatically:

Decimal	Binary
255	11111111
+ 1	
256	1 00000000

Look closely at the binary example. Each digit represents a bit of the A register (or any other eight bit location). Assume for now that my answer is correct, and you will note that we are now trying to place a nine bit number into an eight bit hole! The answer returned in this case would be 0, instead of the expected answer of 256. Our example shows an eight bit overflow, but can you see how we overflow a register pair (sixteen bits)?

Our friend, the CPU, has a special register, F, which we learned stands for Flag. It is called this because its job is to keep track of various things for the CPU. This is accomplished by the setting or re-setting of a bit of the F register. Setting a bit makes it a 1, and re-setting it makes it a 0. We will discuss this in some detail at a later time.

The bits are referred to as flags due to the fact that they indicate whether or not a certain condition exists. The flag we are now interested in, is the Carry

flag. We will also discuss the F register later, therefore, we only need to consider the Carry flag now.

In the above example, we found we would receive an answer of 0. The ninth digit is not lost, as it is placed in the F register as the carry flag. In other words, the Carry flag takes on the value (either 1 or 0) of the overflow from out arithmetic operation. We will soon see why we would want to save the carry.

Back to the math instructions. We have available the instruction ADC which is read add with carry. To see the difference, another example:

```
Add A,E      means Let A=A+E
ADC A,E       means Let A=A+E+Carry (keeping in mind that the carry will again be set or reset by the result)
```

ADC will allow us to chain together the needed additions to guarantee the correct result. Some of the same results can be achieved with the register pair instructions, however, there can still be overflows. Study the following to see what I mean:

```
Ld HL,00A0H      Ld H,00H
Ld BC,7FFh       Ld L,40H
Add HL,BC         Ld B,FFh
Ld B,H           Ld C,7fh
Ld C,L           Ld A,L
Ret              Add A,C
                Ld L,A
                Ld A,H
                ADC A,B
                Ld B,A
                Ld C,L
                Ret
```

Both of these routines will do the same job. Which makes more sense? Uses less memory? Executes faster? The point is that there are many ways to get the job done and many considerations to why we should choose one over another.

We also have SBC or subtract with carry. This one is special because it is the only way to perform sixteen bit subtraction. We cannot Sub HL,BC. We must SBC HL,BC which implies we know the status of the carry flag. We may not know what's on carry's mind, but we can clear the carry flag prior to performing a SBC by doing an addition, that we know will not generate a carry. One that will work in all cases is Add A,0. The value of A is unchanged and the carry flag is reset (0) or cleared as there is no overflow. We will find other ways to clear carry, soon.

We need to be aware that HL acts as the accumulator for sixteen bit arithmetic operations. HL has much the same favorite status with the CPU as does A. The reason we need an eight and a sixteen bit accumulator is that we cannot add or subtract registers from register pairs and vice versa. In other words, we cannot Add HL,A.

The last instructions for this lesson are special cases of Add and Sub. They are Inc and Dec which are short for increment and decrement. Each will Inc or Dec by one. For example:

```
Inc HL      means Let HL=HL+1
Dec HL      means Let HL=HL-1
```

Armed with these new instructions, see if you can rewrite the addition routine we had in lesson 2, to avoid the overflow error it contains. Make sure the last instruction is a Ret and use PRINT USA address to run it and return the answer to BASIC. See if you can write a similar routine to perform subtraction.

A final note on the charts I am providing. This is the last time I will include the abbreviations comments. Also, you can usually substitute IX or IY for HL and (IX+d) or (IY+d) for (HL). Therefore, I will not include them in the charts.

Until next time...happy computin'.

Chart 3	
Registers	Register Pairs
ADD A,r	ADD HL,rr
ADD A,n	ADD HL,SP
ADD A,(HL)	ADD TL,rr
ADD A,(IX+d)	ADD TL,SP
ADD A,(IY+d)	ADD IV,rr
ADC A,r	ADC IV,SP
ADC A,n	
ADC A,(HL)	ADC HL,rr
	ADC HL,SP
Sub r	SBC HL,rr
Sub n	SBC HL,SP
Sub (HL)	
	Inc rr
SBC A,r	Inc SP
SBC A,n	
SBC A,(HL)	Dec rr
	Dec SP
Inc r	
Inc (HL)	
Dec r	
Dec (HL)	

Notes: r many single register  
rr many register pair  
n many numeric constant 0-255  
nn many numeric constant 0-65535  
d many displacement 0-255  
nn many address

## TS 1000/1500 PROGRAM CHAINING Part Three

by Earl V. Dunnington

Parts One and Two of this series covered the VARS, System Variables, and the Safe Area methods of passing data from one program module to another in a chained program.

The Above RANTOP method of passing data, in chained programs, is very similar to the Safe Area method and is the best of all the methods, as data stored above RANTOP is protected from LOAD, RUN, NEW, an expanding program, or the expansion of the display file. About the only thing that can wipe out data properly stored above RANTOP is a program crash, a power failure, a program bug, or resetting RANTOP.

The amount of bytes or addresses you can lower RANTOP and still have the program RUN is determined by the Upper and Lower Limits of the Safe Area of the program. In a Chained Program, the module that requires the most memory in order to RUN, determines the address to which RANTOP can be set for the entire program. A method for finding the Upper and Lower Limits of the Safe Area and the minimum setting for RANTOP that will allow the program to run, was presented in the series of articles: "Adventures In The RAM Jungle And Other Mysteries" (see Sept/Oct '85 thru Jan/Feb '86 issues of TQM).

When the computer is turned on, the address of RANTOP is the first nonexistent byte at the top of the user

available Random Access Memory (RAM). For the 1k ZX81, this address will be 17408; for the 2k TS 1000 it will be 18432; and for the 16k TS 1500 it will be 32768. When a 16k Ram pack (TS 1016) is attached and the computer turned on, RAMTOP is at address 32768 for all three computers. To check the address of RAMTOP, ENTER:

```
PRINT PEEK 16388+256*PEEK 16389
```

This only returns the value stored in the system variable RAMTOP. To check that RAMTOP is actually at this address, let A= the address stored in the system variable. Then ENTER:

```
PRINT PEEK (A-1)
```

The result should be 62

In the case of the TS 1500 with the 16k Ram Pack attached, the bytes from address 32768 to 49151 are above RAMTOP and can be used for storage of data including machine code programs. Any part or all of the additional memory can be incorporated into the BASIC programming area by raising RAMTOP. Of course RAMTOP can also be lowered.

Should you have an odd amount of RAM, to find the maximum address to set RAMTOP, add to 16 the k of the RAM and multiply by 1024 (the number of bytes in one k). For example, if you have four k RAM:

```
(16*4)*1024=20480
```

However, the maximum address that you could set RAMTOP is 65535 not 65536 as the maximum value you can POKE into an address is 255.

RAMTOP can be lowered to make room for the storage of data by POKEing the address desired into the system variable RAMTOP and then entering NEW. The system variable RAMTOP consists of two bytes located at addresses 16388 and 16389. The formulas for POKEing the low byte into the lower addresses and high byte into the higher addresses are given on page 134 of the TS 1000 and page 160 of the TS 1500 User Manuals. For example, to set RAMTOP to 18000, then  $n=16388$  and  $v=18000$ . Substituting in the formulas, type into the computer:

```
10 POKE 16388,18000-256*INT (18000/256)
```

```
20 POKE 16389*1,INT (18000/256)
```

```
30 NEW
```

Now RUN the program. To check that RAMTOP was moved, ENTER:

```
PRINT PEEK 17999
```

The result will be 62. As you can see, the NEW command wipes out the program. It also destroys any variables, strings and dimensions. This precludes the use of this method of setting RAMTOP in a module designed to automatically LOAD the next module of a chained program. A routine for setting RAMTOP without destroying the program or any variables or strings was presented on pages 9 and 10 of the July/August '85 issue.

Although RAMTOP cannot be set using NEW in a module designed to LOAD the next module, it is used in some types of programs where the operator does the linking. NEW is also used where machine code is to be shifted above RAMTOP to wipe out the program in order that a new program be typed into the computer. This can be accomplished by POKEing the code into the Safe Area for the program, before the line containing NEW. For example, clear the computer memory by turning it off and then back on. Type in the program given above adding the following line:

RUN the program. Now ENTER the direct command:

```
PRINT PEEK 18001
```

As you can see the 255 is still in address 18001, RAMTOP is set below this at 18000, and the program has been destroyed.

For the 1k RAM ZX81: Set RAMTOP to 17000 using  $v=17000$ , PEEK 16999 for the 62, change Line 25 for address 17001, and PEEK 17001 for the 255.

If you intend to do serious programming, work with chained programs or use word processors, then you should have two accessories besides an interfaced printer. The first is a tape recorder (or other storage device) capable of consistent SAVES and LOADS. Two is even better, one for LOADING programs or data connected Ear to Ear with the computer, the other for SAVING programs or data connected Mic to Mic. I use a Radio Shack CTR-51 only for LOADING as it has a wider allowable volume control setting range on some commercially produced software. My other tape recorder is a GE Computer Data Recorder model no. 3-5158B.

The second accessory is an emergency power supply particularly in Florida where we refer to the power company as "Florida Flicker and Flash". Figure No.1 is a circuit diagram for an automatic emergency power supply that will maintain the program for power interruptions up to 15 minutes. You must remember to throw the switch off before disconnecting the regular computer power supply or before plugging into the computer.

In addition to the parts listed on the diagram, you will need the following items:

- 1 project box large enough to accommodate the circuit plus the four batteries.
- 1 rubber grommet to protect the leads to the computer.
- 4 nine volt battery connectors.
- 1 two conductor 1/8" modular phone jack, open circuit type, panel mounting (Radio Shack 274-251).
- 1 two conductor 1/8" mini phone plug (Radio Shack 274-286).

The use of a 12 volt lantern battery instead of rechargeable 9 volt batteries and a battery powered tape recorder, would allow the SAVING of the program or data. However, leaving the switch on inadvertently without the computer power supply on could be costly. If you use the 12 volt battery, also use 2.5 amp silicon diodes (Radio Shack 276-1114). As diodes are easily damaged with heat...heat sink them while soldering.

A practical chained program illustrating the Above RAMTOP method of passing data will be presented in Part Four of this series of articles.

## Understanding And Upgrading The TS1016 RAM Pack

by Tim Stoddard

This is the first of a two part article on how dynamic rams operate, how the TS1016 works, and how to upgrade the ram pack to use the newer 5 volt-only 64k dynamic rams.

First let me put to rest all the fears that are probably running through your minds right now! Dynamic RAMs have had a bum rap for years. They are not only EASY to use but they are also much easier to wire up! Have you wired, or can you imagine wiring up, an array of 64k memory using static random access memory? Even if you used the now inexpensive 6116 CMOS 2k byte-wide RAMs you would need 32 of them, plus the supporting selection logic on a board that is barely fit in an S100 system! I used the 6116s in a 640K ram in CMOS ram (8k byte-wide), then the resulting 8 28-pin chips plus selection logic would fit on a board about the same size as your TS1000/ZX81 computer!

Dynamic RAMs, or DRAMs for short, are constructed of simply one transistor and one capacitor per data bit. Static RAMs, or SRAMs for short, are constructed of a flip-flop consisting of 4 or more transistors per bit. Right off you can see that the SRAMs consume much more power and much more die space (die is the actual silicon chip that the DRAM is made of) than DRAMs. DRAMs are not without fault, however, in that they require a small amount of attention to timing, and refresh to use.

With SRAM, you simply supply an address and wait for the required access time for the data to appear at the output. DRAMs, on the other hand, require multiplexing of the address bus. Why? Take a look at a typical DRAM such as the one in your T31016 ram pack and count the leads on the IC body. I count 16. Well, lets see...the 4116 runs used in the T31016 ram pack need 3 supply pins (+5, GND), 2 address pins (+5, GND)...that leaves us 12 leads for address and control. 12 pins for 16 address lines are used for power (+5, GND), so that would leave 14 pins for address and control. How let's supply the 14 address lines needed for 16K, or for the 64K DRAM 16 address lines...oops, we just ran out of pins.

The manufacturers came up with a scheme for cramming 14 lines into the 7 that are needed for the 16k DRAM, or 16 lines into 8 needed for the 64k DRAM by multiplexing them: First, you supply the lower 7 or 8 address bits to the address lines and strobe them into the DRAM. The DRAM contains a Row address latch that holds these 7 or 8 address bits, and in fact, the strobe line used to strobe them in, is called RAS (Row Address Strobe). Next, we switch to the upper 7 or 8 address lines via a TTL multiplexer switch and then strobe in the column address using a second strobe line on the DRAM chip called CAS (Column Address Strobe). Lastly, we wait the required access time and then read the data out of the DRAM. The only other requirement we must observe is the refresh timing needed by the DRAMs.

Since each bit in a SRAM consists of just one transistor and a capacitor, it is easy to see that there is no stable state like that in flip-flop type memory found in DRAMs. The capacitor soon starts to lose its charge via leakages of one type or another, and before you know it you've lost the state that was stored in that capacitor. In order not to lose the capacitor's state we must periodically refresh each capacitor to preserve its current state. Refresh simply means that we want to preserve whatever state the storage capacitor is currently in, the two states being charged for a logic high, or discharged for a logic low.

The manufacturers determined that if each capacitor was refreshed within a specific amount of time, enough of its charge would still be there to determine what

its current state should be. For most 16k DRAMs such as those in the T51016 ram pack, and the newer 64k DRAMs, each location must be refreshed every 2 milliseconds.

Reading at 16,384 locations to refresh the DRAM, would a considerable amount of time. Another way to refresh the DRAM is needed to keep the refresh time down. One way takes into account the fact that when a row is addressed, that ENTIRE ROW is refreshed! So if we address just 128 row locations, the entire 16k would have been refreshed. I should also point out at this time that the 64k drams are internally arranged so that they can be refreshed in 16k blocks. Since the DRAMs are internally set up in 16k blocks, and the row addresses are supplied to each of the four 16k blocks at once, it follows that only 128 refresh cycles will refresh the entire DRAM.

A method that takes advantage of an entire row being refreshed while applying the row address is called RAS only refresh. It is enabled by supplying the refresh address to the address pins of the DRAM and then enabling the RAS line ONLY. This will refresh the entire row addressed by the address pins. Also, since we do not supply the column address and the CAS signal, the DRAM will not complete a true read operation, and therefore, will not output any data, but will remain in a tri-state condition.

There are a number of other refresh modes, especially in the newer 64k and 256k DRAMs, and if there is enough interest in this article, I'll describe those modes in a future article. For now, let's proceed to the inter-workings of the TS1016 ram pack with this new knowledge of DRAMs under our belts.

I could not procure a schematic of the ram pack, so I dissected a ram pack that I own and drew a schematic

from that. During the following discussion, please use the schematic in figure 1, and the timing relationships in figure 2.

The first thing you Z80 hackers will notice is that there is a refresh counter in the ram pack. Anyone who has worked with the Z80 knows that it has its own refresh counter on chip, so why use an external one? The "R" register, as it is called in the Z80, is used in the display interrupt routine to count the number of characters per line, and since the "R" register is manipulated a lot in this routine, it would not be wise to use this register to preserve your data.

ICs "A" and "B" are 74LS157s (labeled 2 line to one line multiplexers) and are used to switch in the refresh address counter IC "E", a 74LS393 dual binary counter. The counter is needed to "remember" what address we need to refresh. The refresh request signal is supplied by the Z80 CPU in your TS/ZX computer and is called REFRESH on the schematic. So when REFRESH (active low) comes into the ram pack it gets buffered and inverted by gate "F4" and is then sent to pin 1 of both ICs "A" and "B" which will cause them to select the inputs suffixed with a "1" (A1, B1, C1, and D1). Those inputs come from the outputs of the 74LS393 refresh address counter. Note also that the same line used to select the refresh counter will also advance the counter one count AT THE END OF THE CURRENT REFRESH CYCLE. The counter will now contain the next address needed to refresh. ICs "C" and "D", also multiplexers, are switched by gate "G4" which is enabled by gate "F1" via gate "F2". During a refresh cycle there are no active RD or WR signals from the Z80, so the output of gate "F1" is low, the output of gate "F2" then is high, and the output of IC "G4" is also high. The multiplexers "C" and "D" therefore, take input via the inputs suffixed with a "1" (A1, B1, C1, and D1), which is from the refresh counter via the multiplexers "A" and "B". The DRAM address lines are at this point "connected" to the refresh counter IC "E" via the four multiplexers.

The last requirement to refresh the DRAM is to supply the RAS signal. This is accomplished with the MREQ signal supplied by the Z80 CPU. The MREQ signal is buffered by gate "G2" and supplied directly to the RAS input of the DRAM. This low-going signal latches the refresh address in the DRAM causing that entire row to refresh. Note that since gate "G4" is disqualified by the output from gate "F2", which we discussed earlier, its output will never change during the refresh cycle. This will keep the refresh address supplied to the DRAM and also keep the CAS line to the DRAM inactive (high) throughout the refresh cycle, thus preventing a true read operation of the DRAM. The output of the DRAM, therefore, during refresh is at its tri-state condition. The MREQ signal now goes inactive (high) which removes the RAS signal from the DRAM ending the refresh cycle. Finally, the inverted REFRESH signal coming out of gate "F4" now goes low, switching the multiplexers "A" and "B" back to the system address lines, and at the same time the low-going signal advances the refresh counter IC "E" via pin 1 to the next row address in preparation for the next refresh cycle. That wasn't so bad was it? Now for a RD/WR cycle.

First, keep in mind that because the REFRESH signal is inactive during a read or write cycle, the multiplexers "A" and "B" are supplying address lines A0 through A6 to the inputs suffixed with a "1" on multiplexers "C" and "D". Multiplexers "C" and "D" now select either system address lines A0 through A6, or system address lines A7 through A13.

The first signal to occur after the system has supplied the proper address is the MREQ signal. This signal, after passing through buffer "G2", is supplied to the RAS pin of the DRAM. At this instant, when the RAS signal has just gone active (low), the DRAM is "looking" at system address lines A0-A6, and this address gets latched into the DRAM's internal RAS latch. MREQ is also supplied to gate "G4" via a time delay net-

Figure 2

work consisting of a 300 ohm resistor and a 47 PF cap.; and before the MREQ signal has had time to get through the time delay circuit, the output of gate "G4" is at its inactive (high) state. This keeps multiplexers "C" and "D" selecting address lines A0-A6 via multiplexers "A" and "B". About 50 to 100 nanoseconds later the MREQ signal finally gets through the time delay circuit and partially enables gate "G4". The other leg of gate "G4" is enabled for a read or write operation (which we are doing) and system address line A14.

System address line A14, when in its high state, is used to select the ram pack by placing it in the 16k to 32k system address range. Note that since the last address line A15 is not defined anywhere, a mirror image of the ram pack will be found in the 48k to 64k area of system ram. Anyway, gate "G4" is now active and its output goes active (low). This signal now switches the multiplexers "C" and "D" to the system address lines A7-A13. Note, too, that for multiplexer "C" the output 2C goes from high to low via inputs C0 and C1. This will supply a low going signal to a second time delay circuit. Why? We have just switched the address lines to the DRAM and before latching the address in the DRAM, we must now allow some time for the multiplexer output to "settle" before enabling the CAS signal to the DRAM, this time is given to us with the second time delay circuit. After 50 to 100 nanoseconds the signal gets thru the time delay circuit and is supplied to the CAS pin on the DRAM. This latches address lines A7-A13 into the CAS latch in the DRAM. About 50 nanoseconds later, the DRAM will supply its output data via pin 14 to the system data buss during a read cycle, or for a write, it will strobe in the data from the data buss on the falling edge of the Z80 supplied WR signal.

The only way the DRAM knows what type of cycle the Z80 is in, is via pin 3 on the DRAM. When low, it is a write cycle, and when high, a read cycle. This signal is supplied by the Z80 CPU and occurs during the MREQ signal. After the Z80 has read or written the data, it will make the MREQ signal inactive (high), this will then make RAS inactive (high), also causing gate "G4" to switch multiplexers "C" and "D" back to inputs A0-D1 thus causing CAS to go inactive, tri-stating the DRAM's data output and ending the read/write cycle.

The one transistor circuit at the bottom of the schematic is a OC to OC converter that supplies the needed +12 and -5 volt bias supplies for the 4116 DRAMs. This circuit is a source of a lot of noise and will be eradicated when we upgrade the ram pack.

I know that the above discussion is somewhat "dry", but if you can come to understand what is going on, you'll be a long way into understanding what makes your computer "tick".

In the next issue, I'll present the needed modifications to upgrade the TS1016 to 64k, plus some of the unusual restrictions imposed by the TS1000/Z801 architecture in designing 64k ram systems.

# POWERFUL AND INEXPENSIVE BUSINESS SOFTWARE FOR ZX81, T/S1000 and T/S1500 COMPUTERS

## ZX-TEXT

## ZX-CALC

## ZX-CALENDER

A word processor is to a computer user what a typewriter is to a typist, except that the former has more advantages than the latter. ZX-Text can operate in 16-64K RAM providing from 1300 to 5500 words per document. It features 6 different options: write, read, edit, print, save and clear text. Text is written on a per-line basis with quick speed and with horizontal back-space and delete capabilities being available. You can also access the editor directly from write mode and vice-versa. Text can be proof-read on a per-line basis allowing for enough time to determine if any editing is needed. The text editor allows a line of text to be deleted, inserted, replaced and listed for editing. You may also change a word or expression within a line, stop or start text while it is scrolling up the screen, begin reading text from the first line of the file, re-enter write mode from the editor, return to the main menu or create a window so that you can read/edit two files simultaneously. The print option takes text displayed in 30 column format on the screen and outputs to either the ZX/TS printer (With Memotech's Centronics Parallel Interface 80-column and lower/higher case output is possible). Files may be saved on tape cassette with the use of one single command, or by the same token they can be erased from memory / storage so that the full capacity of the program can be used for other purposes such as composing letters, reports, articles, memos, standard forms, instructions, ads, graphs, telephone directory lists of customers, members, friends, etc. Also copies of files are always less expensive and easier to run than using a photocopier. Other advantages are savings in time, paper, ink, correcting mistakes and adding afterwards more efficiently than doing them through other handwriting or using a typewriter.

**\$16.95**

An electronic spreadsheet calculator is the functional basic tool for running, reporting and analyzing in matrix form any accounting, mathematical or scientific manipulation of numbers. ZX-Calc operates in 32-64K RAM and affords a maximum of 3360 characters/speedsheet. The entire matrix consists of 15 columns (letters A-O) and 30 rows (numbers 1-30) with 8 characters per cell. Unlike other popular ESCA ZX, Calc has a calculated one and when it calculates 14 main functions on the ZX-81/T/S1000. It offers a unique "SUM" function that totals one or more rows/columns simultaneously. Parentheses can be used within equations. There is no fixed limit on how many equations may be entered. Formulas may be stored in all 420 cells of the spreadsheet. The display affords 15 rows/columns. Load of data into more than one cell can occur across/down one or more row/column simultaneously. With vertical windowing you can arrange a set of columns in any order or practice using fixed/variable alignment display formats. The menu offers 5 options: enter/erase, move/calculate, print/save and clear the spreadsheet. Enter/erase allows the entering, deletion or data alignment within a cell through the use of a mode/cursor. With the move option you may move around the entire spreadsheet to access any row/column or cell. The calculate option allows you to enter/erase values or formulas into a cell or write and enter equations that will impact on the data already within the spreadsheet. You can also enter bar graphs into a cell in this option. Absolute/relative position down/across a column/row is also allowed by this option. Also this option allows the automatic calculation of the entire spreadsheet with one single command. Print allows you to output to either the ZX/TS printer the entire spreadsheet by columns/rows and row/pages through use of the COPY command. The entire spreadsheet may be saved on cassette tape or you may clear an area from it or erase the program from RAM entirely. The most salient advantage provided by an ESC over specifically vertical applications software is that an ESC provides a flexible framework with which you can compose any specific financial model greater than just be limited to only one standard format for storing, displaying and manipulating numerical data.

**\$16.95**

**\$3.00 SHIPPING AND HANDLING PROGRAM**

Time management is an important aspect of any serious business and personal agenda. Planning how to spend your time versus tasks better prioritized before and while we are spending it, and we remain better organized after we finish spending it. ZX-Calendar operates in 16-64K RAM affording 25 appointments in 18K, 100 in 32K or 180 in 48K and 84K. Each appointment record holds a maximum of 220 characters. The main menu includes enter, search/check/abort, change, save, clear and print any and all appointments made on a specific date or with any party. Output to either the ZX/TS printer is permissible. This program will permit you to remember to do something or to be somewhere important by categorizing your answers to be questions that you must account for in order not to waste time when it is scarce when, with whom, at what time, for how long, where and what are you going to discuss and conclude when you get together with someone else? The program lets you permanently originate record, classify search, sort, calculate, modify, summarize, obtain a written report and store your answers to the preceding questions so that you will not forget what you decide to do with your time. This program identifies your time according to when you are going to spend it and with whom you are going to share it. Through these forms of labeling appointments you are able to verify or modify how your time is budgeted without wasting ink, paper or more time trying to remember what you said to yourself or what someone else said to you or where you placed certain written messages that you now can't find. With the program you will know where you can find exactly what you need to know about where you want to and have to be or where you have been before you get and after you get there. Thus, ZX-Calendar will let you plan your time so that you will never have to worry about what is ahead or what came before for you will always know by using it, to never be caught off guard by any time-frame.

## WEYMIL CORPORATION

...makes a serious commitment to the Timex user in the development of high-quality, innovative, and user-friendly software, complete with layman-oriented documentation, and all at affordable prices. We are proud to offer you:

### \* THRUST\*

Finally, real graphics power for your TS 1000! *THRUST*, the last word in cursor-controlled hi-res graphics for screen or printer output, is a software package composed of *SincArtist HR* and *SincArtist 1.3*. Examine this sample for an idea of the powerful versatility of *THRUST*.

**SINCARTIST 1.3** - The original! Fantastic hi-res graphics delivered to the 2040 printer. *SincArtist 1.3* boasts excellent user-group reviews and is simply the best non-hardware system available. Note these features:

- 192 x 256 high-resolution file displayed in a 48 x 64 screen window
- Circles, triangles, rectangles, quadrilaterals, rays, inverting, and more
- 40 redefinable patterns and a variety of draw and fill modes
- Cursor or joystick control
- No system modifications required

**SINCARTIST HR** - The last word in cursor-controlled high-resolution screen graphics. Copy artwork to the 2040 printer and save to tape. *SincArtist HR* requires a TS 1000 with a socketed 2K RAM, less than \$10.00 in parts, and a few minutes with a soldering iron. Super user-friendly documentation and instructions included. All modifications are fully transparent to other peripherals. **HUNTER BOARD OWNERS: All you need is the FREE hardware upgrade that we provide!!!!**

**THRUST** includes *SincArtist HR* and *SincArtist 1.3* (these programs are not sold separately). The Ultimate Hi-Res Tape is available exclusively from **Weymil Corporation** for only \$20.

### \* MINI XMOD \*

**MINI XMOD** - Allows your *Westridge* or *Byte-Back* modem to up and download Timex programs to any XModem protocol BBS.

- Fully documented with easy-to-follow instructions for the layman
- 16K and 64K versions included
- Ideal for storage in *Hunter Board*
- Produced on high-quality cassette for the ZX 81, TS 1000, and TS 1500

**MINI XMOD** is available from **Weymil Corporation** for only \$20. Please specify *Westridge* or *Byte-Back* version.

P.O. Box 448

Scottsburg, IN 47170

"Greetings human, I am H.E.N.R.Y., winner of the Golden Droid Award at the First International Personal Robot Congress and Expo in 1984. You may be surprised to hear that my brain is really a Times/Sinclair 1000 computer. In fact, you can learn more about me and other projects in a new book by my master, Bruce C. Taylor. The book is called: BUILD A MICROCOMPUTER-CONTROLLED ROBOT. It has over 200 pages, over 80 illustrations, and comes with a great looking custom 3-ring binder. There is even a bonus section for instructors who would like to teach about robotics. You can get your very own copy for only \$17.00 (postage paid) from the nice folks at TIME DESIGNS MAGAZINE COMPANY. Get a head start on personal robotics...the newest high-tech craze. Get my book, and read all about me...how could you go wrong human?"

## TS2068 Trackball Only \$19.95

Originally sold for \$69.95

Specify Cat# TBTMX02

**Plugs into TS2068 Joystick Port and works with all joystick software.**

**Bonus Feature: Also works on Commodore 64, VIC-20, ATARI 800, and more. Contact factory for more complete list.**

You can benefit from our recent purchase of brand new WICO Trackball Controllers at closeout prices. We've taken the model WICO originally made for the Texas Instrument 20/4A and made a very simple modification so it now is fully compatible with the Timex TS2068's joystick port.

WICO is the largest designer and manufacturer of control devices for commercial arcade video games. If you've ever played an arcade video game, chances are you've used a WICO joystick or trackball. You've experienced the superior control. The pinpoint firing accuracy. The exceptional durability.

Features: Phenolic ball offers 360-degree movement. Two optical encoders provide split-second movement. Quick-action fire button for smooth, two handed arcade response and feel. Long 5' computer connection. Heavy duty plastic case for long hard use.

The WICO warranty has been voided by our modification. But we give you our 18-day money back guarantee and a one-year limited warranty from Zebra Systems.

## Timex Games \$2 Each

With your order for a TS2068 trackball you can purchase any of the following Timex TS2068 Trackball and Joystick compatible games at the special low price of \$2.00 each for cassettes and \$3.00 for cartridges.

### CAT# TITLE

Cassettes at \$2.00 each

64001 Androide

64002 Penetrator

64004 Casino I

64005 Crossfire

64007 Dragmaster

64009 Guardian

64012 Fun Golf

### CAT# TITLE

64014 Hungry Horace

64015 Horace Goes Skiing

64019 Horace and the Spiders

64021 Blind Alley

64023 Crazybugs

Cartridges at \$3.00 each

74001 Androide

74005 Crazybugs

## \$5 Off Tech-Draw Jr.

You can save \$5.00 on the purchase of Tech-Draw Jr. if you purchase it at the same time as a TS2068 trackball. Instead of the regular price of 19.95 you can get it for 14.95. See our catalog for a complete description of Tech-Draw Jr. and a list of printers that it supports. Order Tech-Draw Jr. Catalog# C356.

## TS1000 TRACKBALL Only \$39.95

Originally sold for \$109.95

Specify Cat# TBTMX01

**Plugs into the back of**

**TS1000, 1500, 2068, or ZX81.**

We've taken WICO's Apple II trackball and put its controller card on an interface adapter for the Timex bus. Now you can get all the benefits of the Apple Trackball with its intelligent controller card, on your Timex computer.

The Apple trackball controller has sixteen integrated circuits on it that read the optical electronic encoder wheels from the trackball and completely keep track of the trackball movement with separate x and y direction up/down counters. This enables your Timex computer to get the position of the trackball by just reading two input ports. This is a tremendous advantage on the TS1000, since the computer can be left in "SLOW" mode for smooth graphics, while the trackball interface card does all the work.

The Apple II trackballs alone originally sold for over one hundred dollars. Now you can take advantage of Zebra's recent purchase of a large number of them at closeout prices. You get the Apple II trackball with Apple interface card, Zebra's Timex-to-Apple bus adapter, and complete instruction manual with sample routines for all the Timex computers. And all for just \$39.95.

**Ordering Instructions:** Include \$3.00 S&H for UPS. P.O. Boxes and other orders requiring U.S. Mail must add \$4.00 extra shipping per trackball. VISA/MC Accepted. NY Residents add sales tax. Order now! Quantities are limited to stock on hand.

### TRACKBALLS FOR OTHER COMPUTERS

We have bargain priced WICO trackballs adapted to just about every popular computer on the market. Send a SASE or call for a complete list.

# WEYMIL presents...

A small collection of truly innovative products for Sinclair computers

## THRUST TS1000

True hi-res graphics for the TS 1000. THRUST is two great programs on one tape. Sine-Artist 1.3 is the most user friendly software ever developed for printer graphics. Completely cursor and menu driven. For Hunter Board users, there's Sine-Artist HR which produces fantastic screen graphics. THRUST is both the most sophisticated and easiest to use hi-res graphics software ever developed for the TS 1000. If you are ready for no-nonsense, hassle free graphics, then THRUST is a "must have."

THRUST for the TS 1000 only \$20.00

## ARTWORX V1.1 TS 2068

England's finest graphics package! ARTWORX V1.1 establishes a new standard for color graphics with features never before available on small systems. Auto speed control, pull down menus, unique cut and past windows, ZOOM, elastic shapes, multiple fonts, CENTRONICS I/F capability for full-size print-outs, and more. All this plus an absolutely uncluttered screen for full creativity. Easy to use. The joystick controls EVERYTHING except text entry. The highly supportive well-written documentation is almost unnecessary.

ARTWORX V1.1 for the TS2068 only \$19.95

## PIXEL SKETCH AND GRAPHICS EDITOR V2.0 TS 2068

This program by Stan Leskie still remains the finest graphics program produced in the United States and one of the best in the world for the TS 2068. It has had excellent user group reviews and is a snap to use. Well written, step-by-step documentation guides you effortlessly from loading to producing your own "masterpiece." Great pixel and text placement control.

PIXEL SKETCH AND GRAPHICS EDITOR V2.0 only \$19.95

## KRUNCHER TS 2068 / TS 1000

From the Pacific Northwest comes one of the most exciting utilities ever written. KRUNCHER takes any BASIC program for the TS 2068 or TS 1000 and instantly reduces it to the tightest BASIC possible thereby conserving precious memory. Imagine all of those little memory saving tips developed over the years in one program which performs automatically and takes up less than 190 bytes! Simply load KRUNCHER, locate it where you want it, load or write your BASIC program, invoke KRUNCHER, blink your eye and it's done. Memory savings average 20-40%. Great learning aid for programmers of all levels.

KRUNCHER for TS1000 or TS2068 only \$10.00  
(Please specify TS1000 or TS2068)

## TIME MACHINE TS 2068

The first SERIOUS COMPILER for the TS2068. Now you can convert BASIC programs to super fast MACHINE CODE without a lot of hassle. Converts both TS 2068 and SPECTRUM Programs. It functions as both an integer and floating point compiler simultaneously without the restrictions of either. Compiled code can be placed anywhere in RAM. Handles up to 27K of BASIC. Programs can be either written or loaded from tape. You've waited a long time for this one and here it is!

TIME MACHINE for the TS2068 only \$19.95

## RIGTER JOYSTICK INTERFACE TS 1000

This is a software programmable Atari-type joystick interface. It can handle up to 16 different directions or commands easily. It has it's own self-contained memory so that it's software occupies no system ram. The software allows you to configure your joystick to ANY TS1000 game or graphic software (THRUST, for example) and it's ready to go. Rear expansion bus allows other peripherals and the interface is completely transparent.

RIGTER JOYSTICK INTERFACE for TS 1000 only \$39.95

## MINI XMOD TS 1000

Use your TS1000 and Westridge modem to up/download TS1000 software to any XMODEM BBS and use them real. Supports Memotech Centronics I/F and others for print-outs to full size printers. Standard RAM and Hunter Board versions included on same tape.

MINI XMOD for the TS 1000 only \$20.00

## LOADER V TS 2068

This program turns MTERM into a REAL communications program. Here's what you get. Auto-repeat dialing, extra 20 number dialing directory, full TASWORD II and MSCRYPT text file handling capability, disk drive and Wafer drive compatible, multiple loading of Mterm's buffer while on line, and full XMODEM capability. This program is the COMPLETE LOADER SERIES.

LOADER V for TS 2068 only \$10.00

## CLONE TS 2068

A sophisticated program which allows the user to make back-up copies of ANY TS2068 or SPECTRUM software for their own use. Requires no fancy filters or extra tape recorders. Easy to follow instructions make it simple to protect your valuable originals.

CLONE for the TS2068 only \$10.00

## SPECIAL OFFER!!!

Save \$5.00 when you order the combination of THRUST, RIGTER JOYSTICK INTERFACE, and KRUNCHER 1000 you pay only \$64.95

**SHIPPING INSTRUCTIONS** Please enclose \$2.00 shipping and handling with your order.
